Miriam

Just a very minor point: you could merge the 2 bullets relating to replacement fluids in the "Choice of Fluids" section so that you have "Replacement fluids must ('should'??) contain a safe...should be borne in mind. The risk of hyponatraemia may be increased...."

That's it!

Clodagh

Subject: HYPONATRAEMIA

Following SAC surgery and the medical directors meeting last week I have had feedback that we should include some reference to .18% saline and I have added one very brief statement in under 'choice of fluids' and would be happy to have your views. I have made a few other amendments

- Changed title
- refer to child rather than children where possible
- added reference to overhydration ( is this redundant or worth keeping)

Happy to receive all comments- I will be on leave from 21st Dec until 2nd Jan but hope to finalise changes and get to the printers in early January.

I have also attached a first draft from printers - presentation looks good-I thought an A2 would be the right size( twice as big as A3) and that about 300 should provide one for all clinical rooms/ nursing stations in paediatric units. Ignore content in this version -using a previous draft.

I think/ hope this is our final lap.

Many thanks for all your help in drafting these guidelines.

Merry Christmas
