

## Moira C Stewart - Senior Lecturer / Consultant

---

I have a variety of research interests, but all are aimed at identifying risk factors for infants and children, both for short term well-being and future morbidity. In particular I am involved in longitudinal studies of cardiovascular and respiratory risk factors originating in fetal life, nutrition and feeding practices of young children and their long-term consequences, and socio-economic factors influencing child health. The current projects are listed below:

1. Intention status of pregnancy and impact on maternal health behaviours and health outcomes in infants.
2. Longitudinal study comparing fetal well-being and nutrition with prevalence of risk factors for adult diseases in 12 year olds.
3. Identification of physical and psychosocial factors, and their interaction, among young children who are failing to thrive.
4. Comparison of effects of maternal anticonvulsants on infant growth and development
5. Longitudinal follow up of babies born in 1950s - health and well-being at age 50 years.
