1	Thursday, 14 March 2013
2	(9.30 am)
3	(Delay in proceedings)
4	(9.50 am)
5	MR NARESH BHALLA (called)
6	Questions from MS ANYADIKE-DANES
7	(The witness appeared via video link)
8	THE CHAIRMAN: Good morning. Good morning, Mr Bhalla.
9	A. Good morning.
10	THE CHAIRMAN: Am I right that you're somewhere in England?
11	A. Yes, I am in Macclesfield.
12	THE CHAIRMAN: My name is O'Hara, I'm the chairman of the
13	inquiry. After you're sworn in to give your evidence,
14	the questioning will overwhelmingly come from
15	Ms Anyadike-Danes, who's the senior counsel to the
16	inquiry. Okay?
17	A. Okay.
18	MS ANYADIKE-DANES: Good morning, Mr Bhalla.
19	A. Good morning.
20	Q. Can you hear me?
21	A. Yes.
22	$\ensuremath{\mathbb{Q}}$. Can I ask if you have your witness statements with you?
23	A. Yes, I have both the statements with me.
24	$\ensuremath{\mathbb{Q}}$. Do you have your statement that you made for the PSNI
25	also with you?

- 1 A. I have the statement both which I have made, first and
 - second statement.
- 3 Q. For the inquiry?
- 4 A. Yes.

2

6

17

- 5 Q. You also made a statement for the PSNI; is that correct? The police.
- 7 A. Yes. The first statement, yes.
- 8 0. You made a statement for the police on 21 May 2006.
- 9 A. I have two statements here. The first one is
- 10 26 July 2005.
- 11 Q. That's a statement to the inquiry.
- 12 A. Yes.
- 13 Q. You made another statement to the inquiry, which is
- 14 dated 15 August 2012.
- 15 A. Yes, 15 August 2012, yes.
- 16 Q. What I'm asking you is: do you recall also making
 - a statement to the police?
- 18 A. I don't recall that.
- 19 Q. Well, we have it.
- 20 A. Okav.
- 21 Q. It's a relatively short statement and it's very much
- 22 like your first statement to the inquiry. But in our
- 23 records it shows that it was taken on 21 May 2006. Just

2

- for the record, the reference for it is 095-017-074. 24
- 25 A. Okay.

- 1 Q. But you don't remember making that?
- 2 A. I don't have a copy of that. I must have made
- a statement. 3
- 4 O. That's all right. I don't think it says very much more
- 5 in it than you have already said in your two statements
- 6 to the inquiry.
- 7 A. Okav.
- 8~ Q. Can I ask you this: in addition to anything you say in
- answer to the questions this morning, do you accept what
- 10 is in those two statements that you have before you as
- 11 your evidence and as being correct?
- 12 A. Yes, please. Yes.
- 13 Q. Thank you. It may be that as I ask you questions and
- 14 you answer, it may be that you want to change something.
- If it turns out there's anything that you think is 15
- 16 incorrect, just tell us.
- 17 A. Yes, sure.
- 18 Q. But at the moment, as I understand it, you're accepting
- 19 everything in there as correct.
- 20 A. Yes.
- 21 Q. Thank you. I'd like to ask you first a little bit about
- 22 your experience. You set that out for us in your first
- 23 witness statement to the inquiry. The series for
- 24 Mr Bhalla's inquiry witness statements is 034. In your

3

25 witness statement to the inquiry, you tell us -- in

- fact, I think it's your second statement to the inquiry
- at page 2, so that will be 034, page 2. As I understand
- it from that, you qualified as a doctor in India in
- 1975 --

1

2

3

4

8

- 5 A. Yes, that's correct.
- 6 Q. -- and that between 1975 and 1999, you worked in various
 - hospitals in India, Saudi Arabia and the Republic of Treland?
- 9 A. Yes. I worked in India initially, then Saudi Arabia,
- 10 and then in Republic of Ireland.
- 11 Q. And that was in the surgical departments of those 12 hospitals.
- 13 A. Yes. Always in surgical department. Once I had
- graduated in 1975, then I was doing a rotation post in 14 surgery in the institute of medical sciences Varanasi --15
- 16 Q. Yes.
- 17 A. -- and then I was working in surgery throughout. I did get experience in paediatric surgery as well. 18
- 19 Q. And did that become your specialty?
- 20 A. Yes. In paediatric specialty, paediatric surgery I was
- 21 working for three years and nine months in a hospital in
- 22 Bangalore with one consultant general surgeon and one 23 paediatric surgeon.

- 24 Q. Thank you. If I bring you closer to the time of
- 25 Raychel's admission, you came to Northern Ireland

- 1 in December 1999; is that correct?
- 2 A. Yes.
- 3 Q. And you worked --
- 4 A. In August 1999 I came to Altnagelvin and stayed with my
- 5 wife and I joined in August 2000.
- 6 Q. Mr Bhalla, can I ask you to be very careful of turning 7 the pages? If you do that close to the microphone, we
- 8 can't hear you.
- 9 A. Right.
- 10 Q. Thank you. And you worked in Dungannon and Downpatrick;
- 11 is that correct?
- 12 A. Yes.
- 13 Q. Then in August 2000, you came as a specialist registrar
- 14 in general surgery to Altnagelvin?
- 15 A. Yes, in August 2000 I joined in Altnagelvin.
- 16 Q. Yes. From your witness statement, you say that you had
- 17 a half-day induction training when you came to
- 18 Altnagelvin.
- 19 A. Yes.
- 20 Q. And now you are an associate specialist in surgery at
- 21 the Macclesfield District General Hospital.
- 22 A. Yes.
- 23 Q. Does that mean you're a registrar?
- 24 A. Associate specialist is like, you know, we have got
- 25 permanent posts. This is above staff grade and below

1 consultant. So you can say like a junior consultant.

- 2 Q. A junior consultant, thank you, in the old grading
- system.
- 4 A. Like a junior consultant.
- 5 Q. Thank you.
- A. Yes, it's like a junior consultant. I would call this
 associate specialist in surgery.
- Q. Thank you. Can I ask you just a little bit about your
 experience of hyponatraemia before June 2001? Raychel
 - was admitted on 7 June 2001, so I'm going to ask you
 - some questions that relate to your knowledge and
- experience as at that time. All my questions, unless
 - I indicate differently, will all relate to 2001 because
 - that's the relevant period for us. Okay?
- 15 A. Sure.

10

11

13

14

17

18

8

- 16 Q. So as at June 2001, can you just briefly explain what
 - your knowledge and familiarity was with hyponatraemia
 - resulting from a post-operative complication?
- 19 A. As I mentioned in my statement as well, I had training
- 20 at undergraduate level as well as postgraduate level
- 21 regarding management of intravenous fluids, including
- 22 electrolyte disturbance. We used to follow book called

6

- 23 "Medical Physiology" by Ganong. I have always been
- 24 reading that book again and again --
- 25 Q. Can you give us the title of that text?

1 A. It is known as the "Review of Medical Physiology" by 2 Ganong.

- 3 Q. Can you hold it up so we can see it on the camera?
- 4 Can you give us the date or the edition of that?
- 5 A. Yes. Its edition is 1991. This is the second book
- 6 I took. I had a first volume before. So I got that
- 7 version, 1991.

8 Q. So as at 2001, you would have been using that as your 9 reference text?

- 10 A. This was the reference text for [inaudible] at the time,
- but then subsequently when I did fellowship, I used another book called *Clinical Surgery in General: RCS
- 13 Manual".
- 14 Q. Can you give us the date of that?
- 15 A. Yes. This is 1994.
- 16 Q. Thank you.
- 17 A. It was reprinted in 1994.
- 18 $\,$ Q. Thank you very much. Just to make sure that we've got
- 19 those titles and dates clearly, what I'm going to ask
- 20 you to do is, when we have finished taking your
- 21 evidence, if you can communicate with your lawyers and
- 22 make sure they have the correct title and authorship and
- 23 date of those texts, then they can let us have that for

7

24 our records.
25 A. Yes.

- 1 Q. Thank you very much. At that time then, apart from that
- 2 was your reference text and that was your teaching, can
- 3 you help us with what your experience would have been?
- 4 $\,$ A. When I was in India, there were lots of patients.
- 5 Because India is a very warm country, we used to get
- neonates as well as children having surgical problems:
- they go into dehydration and electrolyte imbalance. So
- we had a plan that any patients who are admitted and
- looks either dehydrated or having some electrolyte
- 10 abnormalities, we always used to check the blood serum
- 11 electrolytes every day to make sure that they're
- 12 improved. Sometimes even twice a day, depending upon 13 how the blood levels were.
- 14 Q. And what IV fluids did you use?
- 15 A. We used to use, depending -- the fluid requirement will 16 depend upon the total daily requirement for each
- 17 individual child plus whatever losses we could think
- 18 they would have incurred. The loss could be during
- 19 operation because the abdomen is exposed to air. Loss
- 20 could be due to vomiting, the urine output. Loss could
- 21 be due to evaporation from the skin and if they have got
- 22 diarrhoea you do that. And then if they have had
- 23 surgery, you would expect some changes because the body
- 24 has got an antidiuretic hormone secretion at that time.
- 25 So all those things we'll take into account in deciding

- 1 how much fluid and what fluid is required. Basically,
- 2 anybody who's having vomiting or aspiration from the
- 3 stomach, we'll replace it with normal saline.
- 4 Q. And why is that?
- 5 A. Because whenever there is vomiting, you lose more sodium $% \left[{{{\left[{{{A_{\rm{s}}}} \right]}_{\rm{s}}}_{\rm{s}}} \right]_{\rm{s}}} \right]$
- 6 chloride. That's why it is important to give normal
- 7 saline in such patients. Anybody who is having
- 8 diarrhoea will have to replace potassium because you
- 9 lose potassium during diarrhoea.
- 10 Q. I understand. So we had asked you, Mr Bhalla, whether
- 11 you were aware of the possible dangers of prolonged
- 12 post-operative vomiting where a child might be receiving
- 13 hypotonic fluids. And we don't need to pull it up --
- 14 we have a system where we can call up documents; you
- 15 unfortunately can't see it there. The reference is
- 16 034/2, page 15. Your answer to that was:
- 17 "In those circumstances, the child will develop
- 18 hyponatraemia and all sequential complications."
 19 Do I understand that to mean that you were fully
- 20 aware of the consequences and implications in June 2001
- 21 where you had a child who had prolonged yomiting, who
- 22 was being administered humotonic fluids? You ware
- 22 was being administered hypotonic fluids? You were
- 23 aware --
- 24 A. Yes, of course.
- 25 Q. And when you said that "the child will develop

- hyponatraemia and all sequential complications", what
- 2 did you mean by "sequential complications"?

6

8

10

16

- 3 A. You see, whenever there is any electrolyte imbalance,
- these patients may start getting -- it depends upon what
- electrolytes is involved. Sometimes they can have heart
- irregularities. They can become drowsy. They can start
- having nausea and vomiting. And sometimes they will go
- into -- because of dehydration they can go into
- hypovolaemic shock. It depends upon the degree of
- volume lost and electrolyte imbalance.
- 11 Q. Yes. But if I ask you this sequence: if the child
- 12 starts to develop hyponatraemia because they've lost
- 13 sodium-rich fluids through their vomiting, but they're
- 14 receiving low-sodium fluids through their intravenous
- 15 administration and that's why they're developing the
 - hyponatraemia, if that's not treated, what was your
- 17 understanding in June 2001 of what would happen?
- A. Initially, the child will become lethargic, lethargic
 and drowsy. They may become irritable and then they can
- 20 become drowsy. Sometimes they can have -- if it is
- 21 extreme, they can have tremors or -- tremors,
- 22 irritability of the nerves and as she has -- sometimes
- 23 they can go into the brain oedema.
- 24 Q. Cerebral oedema?
- 25 A. If it's an extreme -- cerebral oedema.

10

- 1 Q. And if you wish to avoid that sequence of events that
- 2 you've just outlined, what is the treatment once you
- 3 appreciate that the child has developed hyponatraemia or 4 is developing it?
- 4 is developing it:
- 5 A. First of all, we should avoid any child to undergo
- 6 a drastic hyponatraemia by making sure that we have
- 7 given adequate and proper fluids to begin with. And
- 8 whatever losses are there, to replace that.
- 9 Q. Yes.
- 10 A. We have to give normal saline, but at a slow rate, to
- 11 slowly move it. It depends upon how much is the
- 12 severity of hyponatraemia. If it's a mild
- 13 hyponatraemia, you can straightaway start normal saline
- 14 and give that and check the electrolytes in 12 hours'
- 15 time to see whether the child is improving or not with
- 16 that. If it is a severe hyponatraemia, then we have to
- 17 restrict the fluid. In adults, normally we restrict the
- 18 fluid to about 800 ml to 1 litres in 24 hours and
- 19 replace -- instead of giving other solutions, we should
- 20 give normal saline to bring it up.
- 21 Q. And in a child?
- 22 A. In a child, we'll have to weigh the child and see the --
- 23 normally the total requirement of a child is the daily
- 24 requirement, which you calculate according to the body
- 25 weight. For the first 10 kg, it is 100 ml per kilogram.

- 1 Next 10 kilograms, from 11 kg to 20 kg, plus 50 ml per
- 2 kg [inaudible] per kilogram. And beyond that, 25 ml per
- kg. This is the daily requirement plus any losses. So
- that's the total fluid requirement and the fluid chosen
- will depend upon what are the electrolytes. If the
- sodium is low, then we have to replace it by sodium
- chloride. If potassium is low, we have to add potassium
- to it, and if we're giving potassium, that should be not
- more than 40 millimoles given over 4 hours and if it's
- beyond that, if the depression(?) is too low, then
- we are to do a cardiac monitoring while replacing
- 12 potassium.

10

- Q. Just while you were calculating the fluid requirements,I wonder if I can ask you this: in a post-surgical
- 15 situation, do you restrict the fluids at all in
- 16 recognition of the possibility of ADH, antidiuretic 17 hormone?
- 18 A. Yes, we do restrict.
- 19 Q. And you were aware of that as at June 2001?
- 20 A. Yes. Yes, yes. Not only that, we have to restrict the
- 21 potassium as well.
- 22 Q. The potassium as well?
- 23 A. The first 48 hours, yes. For the first 48 hours because
- 24 of the trauma, there is more potassium in the
- 25 circulation, so it should be reduced and the kidney is

1 retaining because of the antidiuretic hormo

- 2~ Q. What you have just been explaining, how much of that
- 3 were you actually taught as a student and trainee and
- how much of that have you acquired as a result of your
- 5 experience?
- 6 A. Most of it, when we undergo a learning process in the 7 [inaudible]. At that time you used to do a vat, a litre
- 8 vat plus -- of course, over the years when we have seen
- 9 that patient is responding well with a treatment, that's
- 10 what we have learnt.
- 11 Q. Thank you. I wonder if I can bring you now to your
- 12 role. You were a registrar when you joined Altnagelvin,
- 13 is that correct, in August 2000.
- 14 A. Yes, please. Yes.
- 15 Q. What did you see as your role as a surgical registrar in 16 Altnagelvin?
- 17 A. My registrar -- as a registrar, my role in Altnagelvin
- 18 was any -- when I am on call, any patients who are
- 19 coming to emergency, go and see them, make a diagnosis
- 20 what the problem is, get all the investigations,
- 21 whatever is required, and treat according to whatever
- 22 diagnosis is there. Also, any patients admitted in
- 23 other wards, which were referred to the surgery
- 24 department, go and see them and treat them as well. If
- 25 there are any serious cases in ward under surgery

- department of all units, I would see them as well.
- 2 $\,$ Q. In terms of offering guidance and assistance to the
- trainee doctors and also referring up to the consultant, how did you see your role there in the hierarchy, if I can put it that way?
- 6 A. The undergraduates when we were taking rounds, the 7 undergraduates will come along with us and we'll give
- bedside teaching at that time and sometimes I will be
- giving some lectures to them regarding management of
- surgical patients.

1

8

9

10

13

18

5

8

12

15

16

17

22

23

- Q. Can I just pause you there, Mr Bhalla? When you said
 that as you did your rounds you would provide bedside
 - teaching, how important did you regard the ward round?
- A. It is very important because when we go and see the
 patients at the bedside, we can know what problems the
 patient has faced during the last 24 hours and take
- 17 appropriate steps to make sure everything is done
 - properly for the next 24 hours. That makes a big
- 19 difference in the patient's outcome.
- 20~ Q. Thank you. I had interrupted you there. You had helped
- 21 us in that bit in relation to the junior doctors and 22 also said you would give some lectures as well. In
- 22 also said you would give some lectures as well. In 23 terms of then being a conduit for information to the
- terms of then being a conduit for information to the
- 24 consultant, what did you see your role there as
- 25 involving the consultant?

- 1 A. My role as a registrar was to take care of daily problems, whatever we can, and if there are any problems 2 which needed more surgical input, I will involve the 3 4 consultant 5 Q. We had asked you whether you were aware of NCEPOD, 6 particularly in relation to junior doctors informing consultants before they embark on surgery. In your 8 witness statement response -- we don't need to pull it up, but the reference for it is 034/2, page 6 -- you say 10 that you were aware of NCEPOD. We asked you: 11 "How do you consider the conclusions reached in the 12 report concerning the requirement for consultant supervision ought to have applied to the management of 13 Raychel's treatment and surgery?" 14 15 If you're looking at it there, Mr Bhalla, it's on 16 page 6, and it's in answer (c). You say: 17 "The consultant surgeon should have been informed 18 and involved before surgery." 19 Then we ask you a follow-up as to: 20 "Whether you regarded the guidance and requirements 21 of NCEPOD as having been followed in Raychel's case." 22 And your answer at (d) is: 23 "It was not put into effect in Raychel's case."
- 24 So just so that we're clear, your view is, if you
- 25 were looking strictly at NCEPOD, then NCEPOD, the

- guidance in that, was not followed in Raychel's case?
- 2 $\,$ A. Yes, but the thing is that the CEPOD list, whatever the
- CEPOD statement was there, this was to do with surgery
- being done after midnight. The study had suggested that
- if some major cases are being done what my understanding
- of the CEPOD was -- that whatever major cases are being
- done after midnight, by junior surgeons along with
- junior anaesthetists, the mortality and morbidity is high.
- 10 Q. Yes, Mr Bhalla, you're right, there was an NCEPOD 11 guidance in relation to operations after midnight.
 - There was also another NCEPOD guidance, which just to
- 13 give you its title, is in 1989, and the title of it was,
- 14 "Who operates where?". And that particular NCEPOD
 - concerned the requirement for consultant supervision of
 - trainees undertaking anaesthetic or surgical operation
 - on a child. That's what that NCEPOD --
- 18 A. Yes, sure.
- 19 $\,$ Q. That's the particular NCEPOD we asked you about and
- 20 that's what we understood you were answering there in
- 21 your witness statement. In fact, now that you have put
 - it like that, let's pull it up. It is witness statement
 - 034/2, page 6. One sees at (c) how the question is put
- 24 and the answer there, and the follow-up question at $\left(d\right)$
- 25 and the answer there. You did go on to say that you

1		didn't think it was necessary for an experienced surgeon
2		to have notified Mr Gilliland about Raychel's surgery.
3		But when you were answering in terms of the NCEPOD
4		guidance, I think your answer was that it hadn't been
5		followed; is that correct?
6	A.	The guidance did suggest that. It was not followed, but
7		in Raychel's case it was not required.
8	Q.	Yes. And in fairness to you, you say that at page 7.
9		In answer to question 6, you say:
10		"If the plan to perform an appendicectomy was not
11		discussed by Mr Makar with senior members of the
12		surgical team, should it have been discussed?"
13		Your answer is:
14		"No, as middle-grade surgeons who are considered to
15		be well enough trained to carry out appropriate
16		management themselves."
17		So although that might have been the guidance from
18		NCEPOD, your view was that in Raychel's case, given that
19		it was Mr Makar carrying out the surgery, it wasn't
20		strictly necessary.
21	A.	Yes, it was not necessary because Mr Makar was trained
22		enough to do appendicectomy, take the decision of doing
23		an appendicectomy and do appendicectomy.
24	Q.	Yes. In fact, he did notify Mr Zawislak, who was
25		a registrar, that he had a case of a paediatric

- appendicectomy and he was going to do it that night. So
- he had notified Mr Zawislak of that.
- 3 A. Right.

1

2

6

8

- 4 Q. In terms now of a supervisory role, at that time in
 - Altnagelvin, did the surgical registrars perform any
 - supervisory role in relation to the JHOs or the SHOs, or
 - did they simply respond to queries from them and
 - a request for assistance?
- 9 A. JHOs were directly supposed to be supervised by SHOs all 10 the time.
- 11 Q. And what does that mean, Mr Bhalla, so far as you 12 understood it at that time?
- 13 A. My understanding was that whenever a JHO has taken
- 14 history, done examination, should discuss with SHO and
- 15 make sure that SHO is happy with whatever diagnosis has
- 16 been reached by the JHO. Whatever investigations JHOs
- 17 carry, again they should get approval from SHO that,
- 18 yes, these are the procedures, investigations carried
- 19 out. So in my knowledge, whatever the JHOs were doing,
- 20 it has to be supervised by SHO all the time. They can
- 21 do whatever is required, but at the same time they have
- 22 to make SHO aware of whatever decision they have made so
- 23 that proper treatment to patients is given. Because
- 24 JHOs are still under training.
- 25 Q. Yes. I don't know, Mr Bhalla, if you've had an

18

- 1 opportunity to read the notes and familiarise yourself
- 2 with the events of Raychel's admission. Have you had an
- 3 opportunity to do that?
- 4 A. Yes.
- 5~ Q. If you had done that, Mr Bhalla, you would appreciate
- ${\rm 6}$ $\,$ that two surgical JHOs had an involvement in Raychel's
- 7 care towards the end of 8 June, which would have been
- 8 the Friday. The first of those was Mr Devlin, who came
- 9 and administered an anti-emetic after Raychel had been
- vomiting for some time during the day.
 A. Sure.
- 12 Q. You're aware of that?
- 12 Q. Iou le aware of chat
- 13 A. Yes.
- 14 $\,$ Q. The second was Mr Curran, who came at 10 o'clock to
- 15 administer a second anti-emetic after the first one had
- 16 not been successful in stopping the vomiting, and by 17 that time there had been one incidence of coffee-ground
- 18 vomiting and Raychel had a headache and, at least her
- 19 parents would say, she was definitely not herself, was
- 20 listless and, as far as they were concerned, was very
- 21 unwell. So he came at that time.
- 22 In terms of what you have just said, those
- 23 interventions, do you consider that they should have
- 24 alerted the SHO to what they were doing?
- 25 A. I think they should have approached the SHO and informed

- 1 this is what they have done if they had any minute
- 2 concerns that this patient is not doing well.
- 3 Q. We asked --

5

6

7

- 4 MR LAVERY: Mr Chairman, I wonder if -- I'm not sure it's
- appropriate to ask this witness about the actions and
- conduct of junior house officers. I know the experts
- are going to deal with this.
- 8 THE CHAIRMAN: Sorry, he's part of the hierarchy, he is part 9 of the surgical hierarchy in Altnagelvin, the JHO to the
 - SHO to the registrar to the consultant. If he says
- 11 in the basis of what should have happened in June 2001
- 12 that the JHO should have advised the SHO if they had any
- 13 minute concern -- or whatever his exact term was -- then
- 14 I think that is entirely appropriate because he was next
- 15 in line responsible. I think it's entirely appropriate, 16 Mr Lavery.
- 17 MS ANYADIKE-DANES: Mr Bhalla, if I can just continue that 18 with you. Mr Zafar gave evidence before you and we
- 19 asked him a similar question. He was the surgical SHO
- 20 on duty. He had seen Raychel at the ward round at about
- 21 8.30 that morning and he had considered what he thought
- 22 would be her development during the course of the day,
- 23 which was extremely favourable.
- 24 A. Yes.
- ${\tt 25}$ $\,$ Q. He thought that she would be home possibly the next day.

- His view was that if those JHOs had been called at that 1
- time to administer an anti-emetic in the circumstances 2
- that the nurses have described, they should definitely
- have told him about it because it was not a development
- that he thought should have happened with Raychel,
- bearing in mind how she appeared to him at the ward
- round. So he would have wanted to know that they were
- 8 doing that and if he had been told that, he would have
- gone and examined Raychel to find out why it was she
- 10 seemed so unwell at that stage. And he also said,
- 11 depending on his examination, that he would very likely
- 12 have told you because that did not fit with, if I can
- 13 put it that way, his profile for Raychel. Does that
- 14 accord with something that you would recognise as a plan 15
- A. As I mentioned, that if JHO has gone and seen the 16
- patient and if there are any concerns, they should 17
- always approach an SHO to let him know what's going on. 18
- 19 And if SHO's not able to go, then they should approach
- 20 the registrar to let the registrar be aware of what's 21 happening
- 22 Q. Even if they themselves don't have particular concerns
- 23 because it may be they're too inexperienced to
- 24 appreciate the significance of prolonged and severe
- vomiting when a child is on hypotonic solutions at the

- rate that Raychel was at, which was 80 ml an hour? Even
- 2 if they're not sufficiently experienced to do that,
- Mr Zafar's comment was they should anyway have told him
- that because that's not what he expected for Raychel.
- It's not what he discussed with Raychel's father or
- mentioned to her father and not what he would have
- discussed with the nurse at the ward round, so on that
- basis alone, they should have told them that they were
- now coming to see a patient who had been suffering from
- prolonged and severe vomiting. Would you agree with that?
- 12 A. I agree with the fact that if JHOs were made aware that 13 this child has been vomiting after so many hours of
- 14 surgery, still she has been vomiting a number of times,
- 15 definitely she needed urgent attention by SHO or, if
- 16 SHO's not available, the registrar.
- 17 Q. Yes. So if the JHOs had been aware that she had been vomiting in the way that I've just described to you, 18
 - then that is something that they should have brought to
 - the attention of the SHO and, if they couldn't reach the
 - SHO the registrar? Is that a fair way of saving
- 22 what --

1

8

10

11

19

20

21

2

5

10

15

16

17

- 23 A. Yes, absolutely.
- 24 Q. Thank you. Can I ask you this, we're moving on a little
- 25 bit, but to keep it in the same theme. If you had been

22

Mr Zafar has gone and examined the patient and notified 2 you, which is what his evidence was -- if we take the 3 first intervention at 6 o'clock in the evening, I'm 4 5 going to ask you what your response might have been. 6 I know it didn't happen, but we're just trying to get your attitude as to what you would have done if you were

contacted either by the JHOs directly or, because

- 8 in that situation. If you bear with me, I'll tell you
- very briefly some of the salient points out of Raychel's
- 10 condition at that time.
- 11
- 12 purposes, perfectly well in the morning at the ward
- round and for a little time after that. She had vomited 13
- once at 8 o'clock that morning. It's the first time she 14 vomited. 15
- 16 A. Yes.
- 17 O. She had then had a large vomit at about 10 o'clock and 18 she had vomited throughout the day and the afternoon,
- 19 and in the afternoon is when the nurses first began to
- 20 be concerned about the vomiting and want an anti-emetic.
- 21 A. Yes.
- 22 Q. In addition to that, she was on Solution No. 18 IV
- 23 fluids and had been on those fluids -- they were first
- started at 10 o'clock the previous evening, there was 24
- 25 a break while she had her surgery, and when she went

- back to the ward they were recommenced at about
- 2 o'clock in the morning, the same rate, 80 ml an hour.
- And that had continued on and, when Dr Devlin arrived at 6 o'clock, that was the position.
- So if Mr Zafar had gone, examined her, gathered up that information, there had been no electrolyte tests
- done that day, what would have been your advice to him?
- 8 A. I would have gone and seen the patient myself and
- determined how much is her heart rate, any tachycardia marked, look at the signs where the patient i
- dehydrated or not and whether the patient is fully alert
- or a bit drowsy. I would have asked for how many times
- she has vomited and roughly, if they could not take
- correct estimate, how much vomit she would have had so
- far, how much would have been her urine output. After
- that, the first thing I would have done is asked them to start normal saline.
- 18 Q. At that stage?
- 19 A. And put in a -- yes, at that stage. But at a slow rate,
- 20 65 ml an hour. And I would have put a nasogastric tube
- 21 to aspirate everything from the stomach, know how much
- 22 quantity is there, what is the colour like. And 23
 - depending upon how much dehydration there is, I will
- 24 give the fluids and also send the electrolytes at the
- 25 same time.

11 12 13 14

At that time, she had been, to all intents and

- 1 Q. Yes. So a full review essentially?
- 2 A. Yes. Definitely full review is essential because she
- 3 was operated on at 11 o'clock in the night. We would
- 4 have expected by 8 o'clock to start -- she should be
- 5 start already oral fluids. And the IV fluids should
- 6 have been finished by maximum 2 o'clock.
- 7 Q. Yes.
- 8 A. We would have expected any child who had got operation
- 9 by a simple, straightforward appendicectomy -- her
- 10 progress should be like that for almost every child.
- 11 Q. Yes. So that's what you would --
- 12 A. But if --
- 13 Q. Sorry, I beg your pardon.
- 14 A. Sorry. But if she has vomited a number of times,
- 15 naturally she's not doing well, there is some reason for
- 16 it. Either the bowel is still a bit lazy, which should
- 17 not happen after so many hours of surgery, or there is
- 18 some electrolyte abnormality going on, which has caused 19 this problem.
- 20 0. Yes. So that's what you would have done at 6 o'clock in
- 21 the evening had that case been referred to you?
- 22 A. Yes.
- 23 Q. I should have told you, I missed out the fact that there
- 24 is only one record of urine output. That doesn't mean
- 25 that she didn't pass urine after that, but the first

And there's no other record of her urine output and there is no real record of her tolerating anything by mouth other than maybe one sip, but other than that there seems to be no record of anything. But if we move on from the 6 o'clock, assuming you

1

2

24

2

5

10

13

15

16

17

20

record of it, I think, is about 10 o'clock that morning.

weren't contacted at the 6 o'clock for whatever 8 reason -- Mr Zafar hadn't been involved or the JHO hadn't done it -- and matters move on and one gets to 10 10 o'clock in the evening, and by 10 o'clock in the 11 evening a different JHO, I have to say, is contacted 12 again because she has continued to vomit. So that first 13 anti-emetic wasn't successful. And not only has she 14 continued to vomit, but the last vomit before that JHO 15 as called had coffee grounds in it. She's complained of a headache -- according to her father, a very painful 16 headache -- for which she has received medication. Her 17 parents are concerned, as are others who have watched 18 19 her demeanour in the ward, about how listless and drowsy 20 she seems, and of course there is more vomiting. There 21 is no further record of urine output, nor is there any 22 record of oral intake, and she has continued on on that Solution No. 18 at the rate of 80 ml an hour. 23

- Her other observations in terms of temperature,
- 25 heart rate, respiration, they were all normal. So if

- 1 you had been contacted at 10 o'clock and had been given
- 2 that information, what would you have done or what
- 3 advice would you have given?
- 4 A. At 6 o'clock, I would have been so much alert about
- 5 these things which were happening because she had passed
- 6 the initial phase of vomiting due to anaesthetic agents.
- 7 Naturally, the problem has become much more severe. So
- 8 there's no question about how to manage this child, this
- 9 child needs urgent attention, make sure that whatever
- 10 the planning I had done at 6 o'clock should be
- 11 implemented there and then and stay back in the ward to
- 12 make sure that I have got the results back and made sure
- 13 that if there's any advice needed from paediatrician, to
- 14 involve them, so that we can correct any abnormalities
- 15 which is causing this problem.
- 16 Q. So if you been notified then at 10 o'clock, not only
- 17 would you have wanted to make sure that all you had
- 18 described in terms of 6 o'clock was put into action, but
- 19 you'd also have taken a more close involvement of her
- 20 care by staying back on the ward until the electrolyte
- 21 results came back and more closely managing her care, 22 including involving the paediatricians if necessary?
- 23 A. Yes.
- 24 Q. And out of your experience, can you help with would have
- 25 been your differential diagnosis for what was going on?

- 1 A. You see, it's very obvious once we have seen the child
 - with all these things going on. The patient has been
 - vomiting. Vomitus always means there is a loss of
 - sodium and chloride and decreases that. Also, once she
- has started having blood in the vomitus, that means
- there has been damage to the lower end of the food pipe
- or stomach, gastritis, and we have to find out whether
- 8 she has got any suggestion of -- because she's
 - complaining of headache, whether she has got any
 - evidence of getting any meningitis or electrolyte
- 11 abnormalities. These are the two things which will be
- 12 coming in our mind at the same time. If the patient is
 - complaining of headache, first of all we have to make
- 14 sure that -- is it due to dehydration and electrolyte
 - abnormalities or not? And secondly we have to think of whether the patient has got any septic focus anywhere
 - which has caused this.
- 18 Q. On the first differential, which is it due to an 19 electrolyte imbalance, what is it that could be causing
 - a headache like that?
- 21 A. Obviously, it is dehydration plus the loss of sodium,
- 22 lack of sodium in the body, which would have caused
- 23 swelling in the brain, which is causing this headache.
- 24 Q. So one concern is that she has started to develop
- 25 cerebral oedema; is that what you're saying?

1 A. Yes, absolutely.

- 2 MR QUINN: Mr Chairman, I hate to interrupt at this early
- 3 stage. Could we just explore for maybe a couple of
- 4 questions the damage to the food pipe? This is an issue
- 5 that has vexed the parents rather over the last few days
- 6 about the different opinions about the vomiting, the
- 7 coffee grounds, and that there was a burst blood vessel.
- 8 We now hear that there was food-pipe damage, which
- 9 I understand is the other condition that was discussed
- 10 by my learned friend when she came back yesterday
- 11 afternoon.
- 12 MS ANYADIKE-DANES: Yes, thank you.
- 13 The question is this, Mr Bhalla: there has been
- 14 differing evidence on the sort of things that can cause
- 15 coffee-ground vomiting and also differing evidence as to
- 16 the significance of coffee-ground vomiting. I wonder if
- 17 you could help us first with the first point: what in
- 18 your view are the types of thing that can cause
- 19 coffee-ground vomiting?
- 20 A. Coffee-ground vomiting can occur due to small-bowel
- 21 obstruction, sometimes the patient has got -- if they
- 22 have been vomiting violently, they can get a little bit
- 23 of tear in the lower end of the food pipe, oesophagus,
- 24 which is known as Mallory-Weiss syndrome --

25 Q. Yes.

29

- 1 A. -- and that little bit of blood stays in the stomach
- 2 and, when she vomits, it will be coffee ground. So
- these are the two common conditions which in her case
- 4 could have caused the coffee-ground vomiting.
- Q. What are the two? That's one, she could develop a Mallory-Weiss tear and, from that tear, you would see the blood and it would manifest itself as coffee grounds. What is the other one?
- grounds. What is the other one:

8

15

- 9 A. Small-bowel obstruction. An obstruction to the small
 bowel, then they can vomit and that can be coffee
 grounds.
- 12 Q. Of the second one which you characterised as
- 13 a Mallory-Weiss tear, is that really to do with the fact 14 that there is so much vomiting or the strength of the
 - vomiting that that causes -- and I put it in layperson's
- 16 terms -- a little rupturing of some of the blood 17 vessels?
- 18 A. Yes. At the lower end of the food pipe there can be
- 19 a rupture of the blood vessels by violent vomiting.
- 20 MR QUINN: The other issue -- I looked this up -- and
- 21 I understand that this Mallory-Weiss tearing is in the
- 22 oesophagus and that, in fact, that can cause other
- 23 complications and it's something that should be treated
- 24 very, very quickly as it can lead to serious
- 25 complications.

30

- 1 MS ANYADIKE-DANES: If you suspect there's a Mallory-Weiss
- 2 tear, how serious is that and how do you go about
- 3 treating it?
- 4 A. The majority of patients with Mallory-Weiss syndrome,
- 5 the bleeding stops on its own, the patient is not
- 6 vomiting again and again. The treatment the majority of
- 7 times, 90 per cent of the times, 99 per cent of the
- 8 time, it is not a complete tear of the oesophagus, it is
- 9 just a tear of the blood vessels in the lining of the
- 10 oesophagus, lower end of the oesophagus, it stops on its
- 11 own and don't give anything orally, give intravenous
- 12 fluids, and give rest to the food pipe, and then the
- 13 patient becomes all right. You don't have to do
- 14 anything further.
- 15 $\,$ Q. Does that mean, in addressing the vomiting and doing
- 16 those other things, you actually will be giving space
- 17 for the condition to heal itself, really?
- 18 A. Yes. Absolutely.
- Q. And does that mean, if you suspect a Mallory-Weiss tear,
 that does indicate to you that there has been
- 21 considerable vomiting or the strength of the retching
- 22 has been quite considerable to produce that?
- 23 A. Yes, absolutely.
- 24 Q. So that's significant as a diagnostic for the doctors to
- 25 then understand something about the nature of the

- 1 vomiting?
- 2 A. Absolutely.
- 3 Q. Thank you.
- 4 A. That means the patient has been having severe vomiting.
- 5 THE CHAIRMAN: Mr Bhalla, does that mean that it is not the 6 normal post-operative vomiting which might come because
 - a child has had an anaesthetic?
- 8 A. The coffee-ground vomiting occurred after quite some
- time after the operation.
- 10 THE CHAIRMAN: Yes.
- 11 A. It did not occur initially.
- 12 THE CHAIRMAN: No.
- 13 A. If it had been -- the first vomitus contained coffee 14 grounds, we'd have thought, "Okay, a bit of trauma
- 15 putting the endotracheal tube would have caused this,
- 16 which has gone into the stomach and she has vomited".
- 17 But the very fact that the initial vomitus was not
- 18 coffee ground, that means most likely it is either
- 19 a Mallory-Weiss tear. The second thought which will
- 20 come in my mind is a small-bowel obstruction.
- 21 THE CHAIRMAN: Thank you.
- 22 MS ANYADIKE-DANES: And then can I ask you to deal with
- 23 a second point of interest, which is: in your view, how
- 24 significant is it if you note coffee-ground vomiting
- 25 sometime after the operation? So you're no longer

1	thinking,	"This	is	some	damage	that	might	have	been	done

- by inserting a tube or something", so it's not that. 2
- Sometime after the operation and sometime after
- a number of vomits, if you notice it then, how
- significant is it?
- 6 A. As I told you before as well, that means the patient would have had definitely guite strong vomiting. So
- 8 definitely we have to --
- 9 0. Is it important?
- 10 A. Absolutely, it's important to realise the patient has
- 11 had a coffee-ground vomiting. That means the patient is
- 12 not doing well at all. We have to be careful about such patients.
- 13
- 14 Q. Yes. Dr Curran, who is the JHO who responded at
- 15 10 o'clock, he didn't know there had been coffee-ground
- vomiting. That was his evidence. He said that had he 16
- known that there was coffee-ground vomiting, then that 17
- to him would have been a red flag and he would have 18
- notified his SHO about that. Would you accept that that 19 20 would have been appropriate action for him to take?
- 21 A Absolutely
- 22 Q. And if he couldn't get his SHO, do you think that is
- sufficiently significant for him to have contacted you 23
- 24 or the registrar?
- 25 A. Absolutely.

1 Q. Directly?

- 2 A. Yes, absolutely
- 3 Q. Thank you. I want now to ask you about the events of
- the early morning on Saturday the 9th; this is round
- about 5 o'clock when you actually were contacted. Your
- evidence has been that even though you were on duty, you
- were not contacted at all or alerted to any difficulty
- in relation to Ravchel until you received the contact at
- about 5 o'clock on the Saturday morning; is that
- 10 correct?

6

8

14

- 11 A. Yes, absolutely. That's correct.
- 12 Q. If we are just clear on that, when you say that you were 13 "on duty and available", does that mean you were
 - physically in the hospital?
- 15 A. Oh yes, of course.
- 16 Q. So if anybody had wanted to contact you in the way that
- 17 I've just been putting to you, subject to you being at
- that time involved with another patient, you were 18
- available to give advice? 19
- 20 A. Absolutely.
- 21 O. Thank you. So then let's come to round about 5 o'clock 22 in the morning. Your evidence is that you got a phone
- call from Ward 6 to tell you that Raychel Ferguson was 23
- 24 very sick, she had developed a rash, had had a seizure,
- 25 and you immediately rushed to Ward 6 to see her. We've

34

- asked you about who contacted you, and I think your
- evidence is that you believed it was a nurse who reached 2
- you. Do you have any better recollection of who 3
- 4 contacted you?
- 5 A. No, I still think it was one of the nurses who rang me.
- 6 Q. It's not a nurse whom you knew?
- 7 A. No, I don't know who contacted me. I don't remember at
- 8 all who was the person who contacted me, but so far as
- I recollect it was a staff nurse from the ward, Ward 6,
- 10 who contacted me. She bleeped me, when I answered the

11 bleep, she contacted me and told me about the patient.

- 12 Q. What I have just read out -- I don't mean the exact
- words, but are those the essential elements of what she 13
- told you or was there anything else that she conveyed to 14 15 VOU?
- 16 A. As far as I can recollect, she told me that Raychel is 17 unwell and she has developed a rash and she has had
- 18 a fit, so she needs urgent attention.
- 19 Q. Did you know at that stage when she had had her surgery?
- 20 A. No, I did not have an idea. She just told me that this
- 21 patient had an appendicectomy and this is what has
- 22 happened to her. I didn't know what -- when and where
- 23 she had the appendicectomy done.
- 24 Q. We have heard in evidence that there are different kinds
- 25 of bleeps that you can receive and there is a bleep that

- you can receive which lets you know it's a very urgent 1
- matter. Can you help us with what kind of bleep you 2
- recall receiving?
- 4 A. No, it was just the bleep which we are already carrying.
 - There was a bleep and as soon as I answered --
- 6 O. Thank you.
 - Δ -- the staff nurse told me that this patient is not
 - well
- 9 Q. Can you help us with roughly how long it took you to get to the ward?
- 11 A. Not more than 10/15 minutes maximum. 10 minutes --
 - Q. Can you remember where you were?
- 13 A. -- because I was in the campus itself.
- 14 Q. Can you remember where you were when you received that 15 bleep?
- 16 A. I was on the campus itself, and as soon as I received
- 17 the message, I just rang and raced to Ward 6.
- 18 Q. When you got there, what did you observe?
- 19 A. When I got there, I saw that Raychel was being
- resuscitated, there was a team of doctors trying to help 20
- her. She had been intubated. The bloods had been sent, 21
- 22 they were getting the report off the bloods and the
- 23 consultant paediatrician was there, examining the
- 24 patient. So when I went and found that she has been
- vomiting, I said, "We must try to put a naso-gastric 25

- - 10

5

8

1	tube"	to	aspirate	whatever	is	there	
---	-------	----	----------	----------	----	-------	--

- 2 Q. Did you actually examine her?
- 3 A. Yes, I did examine her myself. I examined her and
- 4 of course I found that she was having fixed, dilated
- 5 pupils. She was quite unwell. The IV fluids were being
- 6 given, administered to her, and at first my reaction was
- 7 we should put in a naso-gastric tube to suck out all the
- 8 fluids from her stomach to avoid any further vomiting,
- 9 otherwise if she vomit again, it could cause problem to 10 her. And then I said we should catheterise her in order
- 11 to monitor the output as well as send the urine sample
- 12 for checking if there is any infection there or is there
- 13 any electrolyte imbalance there.
- 14 Q. Why did you want to check if there was an infection that
- 15 you could detect from her urine?
- 16 A. Because when I went there, I noted the white cells were
- 17 raised.
- 18 Q. Sorry?
- 19 $\,$ A. The blood reports suggested that the white cells were
- 20 raised --
- 21 Q. Ah.
- 22 A. -- which is a barometer of infection. Sometimes it can
- 23 be raised in infection, otherwise it can be raised in
- 24 trauma as well.
- 25 Q. Can I just ask you [OVERSPEAKING]. If we just pause

there --

1

6

10

14

15

16

17

18

8

13

- A. We wanted to know if there is any possibility of urinary
 infection. I would have sent the urine sample.
 - Q. Yes, can we pause there for a moment? That raised white count was there, as you noted in her notes. Is that
 - something that you might have expected to have been picked up at the ward round?
- A. I don't think the blood test were done in the morning
 after the operation; it was done only when she became
 - unwell in the night.
- Q. No, they did have a raised white cell count from the
 previous evening. It's in her earlier notes and that is
 why I'm asking you that question. If you give me one
 - moment, I'll find it. (Pause).
 - While I look for it, perhaps you can continue. Let
 - me put it in this way: if that information had been in
 - her notes and available at the ward round, is it
 - something that you would have expected to have been
- 19 pursued at the ward round?
- A. You see, if the patient has got raised white cell count,
 we have to think of what are the causes of the raised
- 22 white cells and act accordingly.
- 23 Q. Yes. So if that had been noted at the ward round, what 24 should have been done at that stage in your view?
- 25 A. In my view, when white cells are raised, we have to

- 1 think of what are the source of infection, if there is.
- 2 Common source of infection after operation is lungs,
- 3 urine, the operated area of wound, or is it due to the
- 4 operation trauma itself?
- 5 $\,$ Q. So does that mean there should have been some further
- 6 testing if that had been noted at the ward round?
- 7 A. If it has been significantly raised right from the
- 8 baseline. We have to compare it with the preoperative 9 level of the blood cells, white cells.
- 10 Q. I think that's part of the issue, Mr Bhalla, that the
- 11 while cells were raised when they were tested before her
- 12 surgery, but they were not tested again afterwards. In
- 13 fact, the inquiry's expert surgeon has said that part of
- 14 the investigation should have been to include
- 15 a differential diagnosis from the appendicitis,
- 16 involving something relating to the raised white cell
- 17 count. And his view was that that should have been
- 18 pursued and investigated and certainly should have been
- 19 further investigated once the operation had been done
- 20 and it had been discovered that she didn't have
- 21 a particularly inflamed appendicitis and what she had
- 22 was a faecolith. So his view is that that should have
- 23 been further investigated after the surgery. Can you
- 24 comment on that?
- 25~ A. Whenever there is raised white cell count, we have to

- think of different diagnosis, what could be the reason
- 2 for that. But the way she presented in A&E, with
- abdominal pain which had shifted to the right iliac
- 4 fossa, clinically it suggested appendicitis.
- 5 Q. Yes. I think what the inquiry's expert was pointing to 6 is, yes, there was that pain but there was also pain on
- urination and protein in the urine and raised white
- cells. His view is that a little more thought maybe
- should have gone into why she had those measurements.
- 10 That was his view. So based on that, his view was that
- 11 they perhaps should have waited to see what
- 12 developed: treat the pain by a mild analgesic and then
 - wait for further developments. Meanwhile, testing
- 14 further the urine to see what might lie behind the
- 15 raised white cell count and the pain on urination.
- 16 Would you have accepted that as an appropriate course of 17 conduct?
- 18 A. No, I don't think so. The urine did not have any
- 19 nitrates, which is quite a significant component if the
- 20 patient has got a urinary infection. There were no
- 21 nitrates in the urine, there was just protein.
- 22 Q. That's correct.
- 23 A. There was no evidence of any leukocytes in the urine.
- 24 If leukocytes are there, nitrates are there, then you
- 25 can think of an infection of the urine.

1 0. Yes.

- 2 A. When -- the appendix has got different positions and if
- the appendix is near the ureter, patients can have
- haematuria due to appendicitis. So clinically, if the
- patient has come with a pain which has shifted to the
- right iliac fossa, she has got tenderness there,
- localised at the McBurney's point, and she has got white
- 8 cells, my initial diagnosis will be appendicitis, and
- because if you leave the patients with appendicitis not
- 10 to operate on time, then they can develop complications,
- 11 especially in girls. It is important that the
- 12 appendicectomy should be carried out.
- 13 Q. Yes. When I had asked you, or at least when you were
- 14 giving your evidence earlier about the raised white
- 15 cells, you said that you would have investigated that
- because that was an abnormal response and you might have 16
- been saying that because you thought they were raised 17
- white cells produced from a test taken after her 18
- 19 surgery. If you had realised that that result related
- 20 to a test done prior to surgery, would you still be
- 21 wanting to have further investigations?
- 22 A. As the clinical diagnosis suggested that it should be
- appendicitis and the urine did not suggest any infection 23
- 24 there, because nitrates were not there and leukocytes
- 25 were not there, I would go with the diagnosis of

41

appendicitis

2 Q. Yes.

1

6

8

12

18

- 3 A. I'd have listened to the chest -- the other cause is lung infection, but she did not give any history of
 - cough, bringing out any phlegm and, on hearing the
 - chest, it was all clear. This all suggests the patient has got appendicitis, all the features suggestive of
- appendicitis.
- 9 Q. What I meant was: in your view this warrants performing 10 an appendicectomy and once that is done, if we now move
- 11 to the situation that you came in to at 5 o'clock in the
 - morning, or even at 10 o'clock if you'd come, would
- 13 you have wanted to follow up that earlier urine test and 14 see what the position was then?
- 15 A. I would not have expected -- if the initial urine test is negative, we can't expect that the patient would be 16
- having infection in such a short time again, a urinary 17
 - tract infection, unless somebody has introduced a
- 19 catheter in the [inaudible].
- 20 0. I see. So the answer that you gave was because you 21 thought that test was taken after her surgery
- 22 Mr Bhalla, can I show you this and see whether this is
- a result that was prompting your discussion about 23
- further testing? It's 020-015-025. Do you have the 24
- 25 medical notes there?

42

- 1 A. No, I don't have them. Read it out to me, please.
- 2 Q. Okay. I can read out to you what is written in the
- charts. This is written in at 4.30, so just before you 3
- would have come. It shows the serum sodium level at 4
- 5 118, it shows urea, creatinine, glucose, magnesium,
- 6 calcium, and as we work our way down, it has a white
- cell count of a 17 and alongside it has "N" -- which I
- 8 take to be normal -- "15". Is that what you saw when
- you came at about 5 o'clock?
- 10 A. Yes.
- 11 Q. And if you saw that, are you saying that is what would
- 12 have prompted you to say there should be further
- 13 testing?
- 14 A. Yes.
- 15 Q. Thank you. So if we go back where we originally were
- 16 before I started asking you all these questions. We're
- 17 back at 5 o'clock in the morning, so you arrive, you say
- 18 you examine her, you say that there should be
- 19 a naso-gastric tube, there should be a catheter and
- 20 further testing done, particularly in the light of the
- 21 white cell count; is that correct?
- 22 A. Yes. Not only that, the patient had a seizure, so
- 23 obviously something is happening in brain.
- 24 Q. Yes. Were you able to form any sort of view as to what
- you thought was wrong at that time? 25

- 1 A. Absolutely. The first diagnosis was electrolyte
 - imbalance, hyponatraemia. And the second was whether
- she has had any meningitis.
- 4 O. Yes. And did you discuss your views with any of the clinicians there?
- 6 A. Yes, I discussed with the paediatricians who were
 - already investigating the patient.
- 8 Q. Do you remember who they were?
- A. No, I don't remember the names, but I think I was
- discussing with the consultant and the paediatric registrar.
- 12 Q. Yes. We now know them to be Dr McCord, the consultant,
 - and Dr Trainor, the registrar.
- 14 A. Yes.
- 15 Q. So you told them that you thought there were two things
- 16 potentially happening. One was electrolyte imbalance --
- 17 A. Yes.
- 18 $\,$ Q. -- and does that mean you were indicating to them, if it
- 19 was that, that what was happening was a developing
- 20 cerebral oedema --
- 21 A. Yes, absolutely.
- 22 Q. -- and the other alternative was meningitis?
- 23 A. Yes.
- 24 Q. Do you know what they did as a result of that discussion
- 25 you had with them?

13

2

3

- 10 11

- 1 A. Yes, I was aware -- we got the CT scan done of the
- brain, we sent out for the CT scan. I was involved in 2
- doing -- getting all these things done at the same time.
- 4 Q. Did you see the CT scan, the results as they came off?
- 5 A. Yes, I saw the results of the CT scan.
- 6 Q. And what did they indicate?
- 7 A. I was there present throughout, until I finished my
- 8 duty. I was along with the patient and I didn't go
- anywhere else. I was all the time with the patient and
- 10 monitoring and trying to get the results from the lab
- 11 and checking everything and then discussing them and
- 12 making sure that we are giving the best possible
- 13 treatment.
- 14 Q. What did the CT scan results indicate to you?
- 15 A. The CT scan did show that the patient has most likely
- cerebral oedema. There was also a doubt about whether 16 she has got a subdural haematoma. 17
- 18 Q. That was the first CT scan, is it?
- 19 A. First CT scan.
- 20 0. Were you aware of the fact that there was a second
- 21 enhanced CT scan carried out?
- 22 A. Of course, yes, I was there along -- and we got the
- 23 report that the second CT scan confirmed that it was
- 24 cerebral oedema and there was no haematoma there.
- 25 Q. And were you aware of any discussion between the

- neurosurgeons at the Children's Hospital and Altnagelvin in relation to the CT scan?
- 3 A. I was told that they have contacted, but by the time
 - I think the duty was finishing and I handed over to Mr Date.
- 6 Q. But so far as you're concerned, when you left, it was clear to you that the CT scan was indicating cerebral oedema?
- 9 A. Absolutely.

1

2

8

- 10 Q. Were you aware of how serious that cerebral oedema was?
- 11 A. It was because the patient has had severe headache
- 12 in the night and then she developed a seizure and then, 13 by the time I came, she already had fixed dilated
- 14 pupils.
- 15 Q. Was there any discussion, once it could be seen on the CT scan, about what they would do, what the further 16
- treatment for Raychel would be and what her prognosis 17 18 was?
- 19 A. Of course. From the examination as well as the
- 20 investigation results, it was guite clear that she has 21 got a very bad prognosis with dilated fixed pupils.
- 22 Q. What did that mean to you, "a very bad prognosis"; what 23 does that mean?
- 24 A. That means that she will not survive. 25 Q. Was that your personal view or is that something that

46

- the clinicians were discussing?
- 2 A. I don't remember exactly, but of course I thought that,
- you know, once she has gone to that stage, she's got 3
- fixed dilated pupils, she will not survive. 4
- 5 Q. And were you aware of what was being considered as the
- 6 way forward from that point, what should be done?
- 7 A. Yes. She was to be put in the intensive care unit, she
- 8 was to be monitored closely, and then we were trying to reverse the hyponatraemia by giving her normal saline at
- 10 a slow rate.
- 11 Q. Were you aware of any discussion that she should be 12 transferred to the Children's Hospital?
- 13 A. Yes, of course. I was told that we are in the process
- of talking to the Royal Victoria Hospital in Belfast to 14
- 15 transfer her there.
- 16 Q. Did you know what it was that they hoped would happen
- 17 when she got to the Children's Hospital?
- 18 A. No, I was not aware of that. I just knew that she would
- 19 be transferred from -- you know, in the blue light
- ambulance and that she will be transferred to the 20
- 21 intensive care unit.
- 22 Q. Was there any discussion as to whether anyone thought
- 23 there was a prospect of perhaps surgery alleviating the 24 condition?
- 25 A. No. There was no possibility of that because there was

- no space-occupying lesion which required surgery.
- 2 Q. And as far as you're concerned, was that clear by the
- time you left her and finished your shift?
- 4 A. Yes. In my mind, I thought it is just due to the
 - cerebral oedema, which has to be treated conservatively.
- 6 Q. So in your view, that's the only option because there wasn't anything that was amenable to surgery; that's vour view?
- A. Yes. 9

5

8

11

- 10 Q. Is that something that was shared? Did other clinicians agree that there really was nothing that could be done 12 surgically?
- 13 A. Yes, I think so. As far as I recollect, all of them 14 said she needs intensive care, conservative management.
- 15 Q. For that short period of time when it was thought that 16 she might have a bleed, was there any discussion then
 - that perhaps that could be addressed through surgery?
- 18 A. The second CT scan when it was done made it clear that 19 there was no bleeding.
- 20 Q. I appreciate that. I meant in between the two, sorry
- When you received the first one and it was thought that 21 22 there might be a bleed, was there any discussion then
- 23
- that perhaps surgery might be an option?
- 24 A. Whenever we find there is evidence of bleed there,
- 25 of course there is indication to carry out any surgery

1	by a	neurosurgeon.
---	------	---------------

- 2 \quad Q. So for a period of time, it was thought that that might
- 3 be something that could help her?
- 4 A. As far as my thinking was concern, I was not very
- 5 convinced that it could be a haematoma.
- 6 Q. Ah. So even on the first CT scan, you weren't 7 particularly persuaded that that's what was there and
- 8 that therefore there was a surgical option?
- 9 A. In my view, I didn't think that she was have a subdural 10 haematoma. That's the aim of doing another CT scan. We
- 11 had all the evidence to suggest it was cerebral oedema.
- 12 She was hyponatraemic with sodium of 118, she had no
- 13 history of any bleeding disorders, she didn't have any
- 14 head trauma, I didn't expect any rupture of the blood
- 15 vessel at that stage. Everything was suggesting that
- 16 she has got gross cerebral oedema, which has caused
- 17 coning and resulting in fixed dilated pupils.
- 18 Q. And so far as you're concerned, is that what you thought 19 was confirmed by the enhanced CT scan?
- 20 A. Yes.
- 21 Q. Thank you. Can I ask you a question to do with how
- 22 Raychel appeared to you? From the time you arrived
- 23 there until the time you left, did you see Raychel move
- 24 independently apart from involuntary movements that she
- 25 might have had?

- 1 A. No, I did not see any movement.
- 2 Q. Did you regard her as even capable of movement?
- A. She was already intubated and she was already being
 given support through the endotracheal tube. I did not
 see any movement myself.
- Q. Thank you. Can I ask you just briefly about what
 happened after Raychel is transferred? Raychel, as
 - you know, was transferred to the Children's Hospital
 - later on in the morning of that Saturday --
- 10 A. Yes.

8

9

17

- 11 Q. -- and she subsequently died there the following day on 12 the Sunday. How did you first learn that Raychel had 13 died?
 -
- 14 A. I don't remember exactly, but I think ... I wasn't
 15 informed the patient had died for quite a few days
 16 later, you know. I don't remember exactly who mentioned
 - it to me.
- 18 Q. Did it come as a surprise to you that that was the 19 outcome?
- 20 A. No. As I told you earlier as well, when I thought that 21 she has had cerebral cedema which has led to fixed
- dilated pupils, at the same time thought that she has got a very bad prognosis.
-
- 24 Q. Thank you. Did you hear at all about there being
- 25 a critical incident review meeting to gather together

50

- 1 those who'd been involved in her treatment to try and
- 2 establish what had happened, learn lessons and try and
- 3 see what could be done to make sure that such a thing
- 4 didn't happen again? Did you hear of a meeting like 5 that?
- 6 A. This only I came to know once I received the documents.
- 7 Before that I didn't know there was a meeting like that.
- Q. Was there ever a meeting amongst the surgeons to see, as
 a group, what might be learnt from Raychel's case?
- 10 A. No, I was not involved in any of the meetings.
- 11 Q. Did you ever hear that there were meetings, even though 12 you may not have personally been involved in them?
- 13 A. I learned it after some time, not during the time that
- 14 those meetings were being held.
- 15 Q. If there were -- well, there were. If you had realised 16 that there were going to be meetings about Raychel's
- 17 case, would you have wanted to be there?
- 18 A. Of course, definitely.
- 19 Q. Would you have expected to have been invited to such 20 a meeting?
- 21 A. Of course. I think I should have been invited because
- 22 I was the person from the surgical department who was
- 23 present during the patient's critical time.
- 24 $\,$ Q. You were the most senior member of the surgical team at
- 25 that critical time. Was there any discussion afterwards

- 1 about notifying her consultant, who was Mr Gilliland,
 - that his patient had suffered a very severe
- 3 deterioration and had been transferred to the Children's 4 Hospital?
- 5 A. When I finished my duty, I told Mr Date that that is6 what has happened to this child, and I presumed that he
 - would have definitely gone to inform Mr Gilliland.
- 8 Q. Was it your intention that Mr Gilliland would be
- informed?

- 10 A. Yes.
- 11 $\,$ Q. Did you think it important that he was informed?
- A. I did feel that because this patient was admitted under
 his care, he should be informed, and I asked Mr Date
- 14 this is what has happened and --
- 15 Q. Can I ask you this: the only Date that we are aware of 16 is an Aparna Date, who is an anaesthetist. Can you help 17 us with the Date that you mean?
- 18 A. Her husband was Mr Date, who was the surgical registrar.
- 19 Q. We'll check. But in any event, you informed the
- 20 surgical registrar and asked the surgical registrar to
- 21 communicate that to Mr Gilliland?
- 22 A. Yes.
- 23 Q. Is there any reason why you didn't do it yourself?
- 24 A. Well, the thing was, I did not inform him at that time
- 25 because I knew that this is an abnormality of

- electrolytes and she is being looked after from that 1
- 2 point of view from expert people, paediatricians and
- anaesthetists. There was no need for any surgical
- intervention and so I didn't feel that there was any
- need to inform Mr Gilliland. Of course I wanted that he
- should be conveyed so that he's aware that this is what has happened and that's why I asked Mr Date to make sure
- 8 that he tells him.
- 9 Q. I appreciate that. I can see the answer is that you
- 10 don't think that it was necessary to tell him about that
- 11 and to bring him in, who was off duty at that stage, at
- 12 that time, because others at a high level were dealing
- 13 with Raychel. But why didn't you, after that, when you
- 14 have left Raychel, why didn't you notify Mr Gilliland as
- 15 to what had happened, just to notify him as to what had
- 16 happened to his patient?
- A. I presume that Mr Date will be conveying, so that's why 17
- I did not go myself to tell him. 18
- 19 THE CHAIRMAN: At what point did Mr Date arrive? Were you
- 20 there with Ravchel before Mr Date?
- 21 A Pardon me
- 22 THE CHAIRMAN: Were you with Raychel before Mr Date?
- 23 A. Yes, of course. I was there throughout, from 5 am until
- I left the duty. And before I left the duty, I handed 24
- 25 over the bleep to Mr Date and also conveyed him that

- this patient has become bad and this is what the
- condition is. And I said, "I think we need to inform 2
 - the consultant who's looking after this patient".
- THE CHAIRMAN: Had Mr Date been involved in trying to help Raychel at any point?
- 6 A. I presume that as the patient was still in Altnagelvin
- Hospital, I thought Mr Date will make sure that he knows 8 that the patient has been transferred and he will convey
- the message to Mr Gilliland.
- 10 THE CHAIRMAN: But in terms of the most senior surgeon who
 - helped or assisted Raychel, it was you, is that right --
- 12 A. Yes. Of course, yes.
- 13 THE CHAIRMAN: -- and not Mr Date?
- 14 A. No, he came only when I finished my call. And I handed 15 over that this is what the problem is.
- 16 MS ANYADIKE-DANES: Sorry, when you left Raychel, was that
 - an end of a shift for you?
- 18 A. Yes.

1

11

17

2

8

14

15

23

- 19 Q. I'm just trying to see if that is the reason why you
- 20 communicated that to Mr Date as part of your handover? 21 & Ves
- 22 Q. Did you speak to the parents at all while you were there 23 with Raychel?
- 24 A. I don't remember exactly whether I spoke to them, but
- I did see them and I confirmed from the staff that the

54

the child. 2 3 Q. Who did you think had the responsibility at some stage, maybe not then when there was a lot of activity to try 4 5 and deal with Raychel, but who did you think had the

parents had been informed about the serious condition of

- 6 responsibility to sit down with the parents and explain
- what had happened and what might happen in the future?
- 8 Who had that responsibility?

THE CHAIRMAN: Sorry, in the early hours of the Saturday? 9

- 10 MS ANYADIKE-DANES: No, I said "not at that stage", h
- 11 it's been described as a time of great activity. After
- 12
- 13
- 14

- 21 hor
- 22 Q. So if we're clear then, before Raychel was transferred,
- 23 you had satisfied yourself that members of staff and the 24 nurses had spoken to her parents?
- 25 A. Yes, absolutely.

- 1 Q. Then can you help me with this: what responsibility, if
 - any, do you think that her consultant, Mr Gilliland, had
- to sit down with the parents after Raychel had died and
- go through her notes and explain what had happened?
- 5 A. Well, the thing is that since Mr Gilliland was not aware
 - of all those things, he would not be in a better
 - position to give the exact picture of what happened. I would have expected the paediatrician consultant and
 - the anaesthetist to explain in detail. Of course, if
- Mr Gilliland had come and talked, then again he could be
- 10 11 a part of the team. But as I understand, Mr Gilliland
- 12 was not aware of what has happened. He would have to go
- through the notes and maybe give some information but, 13
 - in my opinion, the anaesthetist and the paediatrician
 - consultant were in a better position to give more
- 16 details to the parents on what has happened to the 17 child.
- 18 Q. Yes. As a matter of taking responsibility for Raychel's
- 19 care, given that Mr Gilliland was her consultant, did
- 20 you think at any point he should sit down with the
- 21 patients [sic] and hear what they had to say and try and 22 answer their questions and try and discuss matters with
 - them?
- 24 A. I would leave it for Mr Gilliland to know -- to decide
- 25 about what he has to do.

- that. Perhaps after she was transferred to the
- Children's Hospital.

A. I think it would be the doctors who were directly

- involved at the time of transfer who knew about the 15
- 16 patient's details could talk to the parents and inform
- 17 them. I did remember that I confirmed from the staff 18 that the team of doctors have talked to and even the
- 19 nurses have talked to the parents and given them that
- 20 the child is serious and this is a bad prognosis for

1	Q.	No, no, I'm asking you as a senior clinician: do you
2		think that's what should have happened?
3	A.	As I told you, the preference will be for the doctors
4		who have been treating and knew details about what has
5		happened and how she deteriorated. If Mr Gilliland
6		would have accompanied them, it would have probably been
7		better. It would have been probably better.
8	Q.	"If he could have, it would have been better", did you
9		say?
10	A.	Yes.
11	Q.	Well, can I ask about your own involvement? You
12		responded at 5 o'clock, you examined Raychel, you make
13		suggestions about her treatment, you form views about
14		what the problem is and even her prognosis, and you are
15		there throughout, even to seeing the two CT scans. You
16		are the most senior member of the surgical team and
17		she's a surgical patient. Did you not think you had
18		a responsibility to sit down with the parents?
19	A.	As I told you, I don't remember exactly, but I think
20		I might have talked to them in brief, but I made sure
21		that they had been informed by the staff. I was very
22		much involved in making sure that we get all the try
23		to get the patient back up by doing things what is

- required for her, getting the naso-gastric -- getting 24
- 25 the bloods done, getting repeat bloods done, getting the

- scan done. I was personally involved in the management of that.
- 3 Q. I mean after that. After that period of time when you have set in train all those investigations, did you not think it was appropriate as the most senior member of
- the surgical team to sit down with Raychel's parents?
- 7 A. Well, by the time I had finished my duty and the child
- was being transferred to the Royal Victoria Hospital. 9 O. You mean --
- 10 A. And I was made aware that patient's relatives have 11 already been informed about what is happening.
- 12 Q. So you mean by the time you had finished requesting the 13 investigations that you wanted done, by that time
- 14 Raychel was on the point of being transferred? There
 - was no time between when you had finished that kind of
- work, when you could have sat down with the parents; 16 17 is that so?
- 18 A. I can't remember exactly, but the thing was that before 19 I left, I had made sure that the parents had been made 20 aware of things.
- 21 0. Yes, you have said that; this is a different point.
- 22 A. I don't remember when I talked personally or not, but as
- far as I recollect, I did give them a brief opinion 23
- 24 about what is happening to her.
- 25 Q. Yes.

1

5

6

8

15

16

1 2

6

8

15

- 1 A. I had talked to them in brief manner. That is what
- I recollect. 2
- 3 Q. Mr Bhalla --
- 4 A. But I did not --
- 5 Q. I just want to put this one final point and then I'll
- 6 leave it. Leaving aside whether you did have a brief
- 7 talk to them or not, do you now think it would have been
- 8 appropriate for you as the most senior member of the
- surgical team to have talked to her parents?
- 10 A. Yes, I believe it would have been good, definitely, if 11 we would have talked.
- 12 Q. Thank you. Subsequently, on 3 September, there was in
- fact a meeting that took place between various members 13
- from Altnagelvin and members and friends of Raychel's 14
- family. There were two clinicians there. Do you think 15
- 16 that that is a meeting where her consultant or members
- 17 of the surgical team should have attended?
- 18 A. Of course. If I would have been knowing of the meeting,
- 19 I would have attended myself, but I was not told about 20 the meeting at all.
- 21 Q. Thank you. Mr Bhalla, I wonder if I could ask you
- 22 a question that relates back to the ward round? We
- 23 touched upon the ward round before in terms of what you
- 24 might have expected to have been investigated at that
- 25 stage, but can I ask you a different question, which is

- this: did you conduct a ward round on 8 June? That would be the Friday. 2
- 3 A. No, I did not conduct any ward round on that day. The
- person who's on call, we get a handover of what are the 4
 - serious problems in the ward. We attend any A&E calls,
 - any referrals, but we don't go and see the patients on
- the ward. We'll see the patients who are handed over or any serious patients.
- 9 Q. When you say "the patients who are handed over", what do 10 you mean by that? Is Raychel a patient to be handed 11
- 12 A. Yes, the patients -- the registrar who was on call
- before me, like I handed over to Mr Date, that during my 13 duty these are the cases -- new cases admitted, and this 14
 - is what the diagnosis I think is, and this is what my
 - plan is, and this patient is serious and requires
- 17 attention --18 Q. Right.
- 19 A. -- and that the consultant should be informed.
- 20 Q. So does that -- sorry.
- 21 A. So when I came on duty, I was handed over by the
- 22 registrar who had done the on-call before me to let me
- 23 know what are the new admissions, what has been done for
- 24 them, any patients needs attention, any patients who
- 25 need to be taken to the theatre, any referrals which

- 2 Q. So Raychel would be on a list as a patient who'd
- undergone surgery the previous evening. Is she a patient that anybody would want to see as a post-take, in your view?
- 6 A. The patients who have been operated under certain consultant were being seen at that time by that team,
- 8 unless they have specific concerns that, yes, they
- should be followed up by the on-call registrar.
- 10 Q. And which is the team that should have seen Raychel?
- 11 Mr Gilliland being her consultant, which is the team?
- 12 A. Mr Gilliland's registrar, his house officer, who are
- 13 there to help him.
- 14 Q. Do you know who Mr Gilliland's registrar was that day?
- 15 A. No, I don't remember, but I think Mr Zafar did go and see the patient. 16
- 17 Q. Yes, he did. I'm asking you a different question. Do
- you know who the registrar was that day? 18
- 19 A. No. No, I don't know. I don't remember.
- 20 0. Would it be the registrar's duty then to identify to the
- 21 SHOs those patients that they should go and see?
- 22 A. Yes, it would be the whole team which is there to make
- sure that they handed over to the next person any 23
- 24 serious problems.
- 25 Q. Yes. You're right, Mr Zafar did go and see Raychel. In

- your view, what was the system? Once the registrar had
- received his list and a handover from the outgoing 2
- registrar, indicating who's had surgery, who has
- particular problems, who should be seen and for what
- reason, once he has that list, how does the ward round
- actually work then?

1

- A. As I mentioned earlier, the patients who had been dealt 8 with will be seen by the team under whom the patients
- were admitted. If a particular person has been operated
- 10 upon by a team, then members of the team will go and see 11 the patients. The registrar on call will see the new
- 12
 - admissions or any patients who require any further
- 13 surgical intervention or if the patients have got any 14
 - serious ailment, the registrar will not go and see all the patients on the ward.
- 15
- 16 Q. Yes. From that point of view, does Raychel count as 17 a new patient?
- 18 A. Raychel has already been operated upon --
- 19 THE CHAIRMAN: Yes --
- 20 A. -- under A team and A team will be the one looking after 21 that
- 22 THE CHAIRMAN: And how is it decided which doctor sees
- Raychel on the ward round on Friday morning, whether 23
- 24 it's the consultant, the registrar or the house officer?
- 25 A. Well, I think, as far as I know, the understanding was,

- if the consultant is available, he can see all the
- patients admitted under that consultant. If he's busy 2
- with something else, then his junior registrar should be 3
- the one who should go and see all the patients. 4
- 5 MS ANYADIKE-DANES: So does that mean from your point of
- 6 view, as you understood it, Raychel should have been
- seen by the registrar?
- 8 A. The registrar in Mr Gilliland's team.
- Q. Yes. If Mr Gilliland was not available, then it should
- 10 have been the registrar who should have seen Raychel?
- 11 A. Yes.
- 12 THE CHAIRMAN: And did Mr Gilliland regularly do ward 13 rounds?
- 14 A. I'm sure he was doing ward rounds, but I don't know
- 15 whether ... Pardon?
- 16 THE CHAIRMAN: Did he do them regularly?
- 17 A. Yes, he was doing it.
- 18 THE CHAIRMAN: On a regular basis?
- 19 A. Regularly ward rounds, unless he was busy with some
- 20 other major issues, he's busy in the operating theatre
- 21 or busy elsewhere.
- 22 MS ANYADIKE-DANES: Mr Chairman, I don't have any further
- 23 questions, but there might be some from the family.
- 24 MR QUINN: Mr Chairman, with your permission, a very short
- series of questions to ask. Could you indulge me, 25

- Mr Chairman, and put up the reference to the fluid
- balance chart? That's 020-018-037. 2
- 3 THE CHAIRMAN: The witness won't have it.
- 4 MR OUINN: I take your point. I'll just ask three or four questions.

 - Doctor, would it be your opinion that doctors and nurses should work as a team?
- 8 A. Absolutely. They should always work as a team.
- MR QUINN: Would it be your opinion that they should relay 10 information between each other?
- 11 A. Absolutely. Communication is most important in carrying 12 out good clinical care.
- 13 MR QUINN: So if nurses were aware that Raychel was vomiting blood, that is coffee-ground vomiting, should that 14
- 15 definitely have been made clear to the doctor who was 16 treating her later in the evening?
- 17 A. Absolutely, yes. Absolutely essential to pass on the
- 18 information to the doctors.
- 19 MR LAVERY: He's already said that, Mr Chairman.
- 20 Ms Anyadike-Danes has already been through this.
- 21 THE CHAIRMAN: What Ms Anyadike-Danes went through was the
- 22 significance of coffee-ground vomiting. What Mr Quinn
- 23 is asking, as an angle to that, is how important it is
- 24 that if Raychel has had coffee-ground vomiting, the
- 25 nurses specifically make that known to the doctor who's

- 6

1	called	to	see	Raychel.
---	--------	----	-----	----------

- 2 MR QUINN: Thank you, Mr Chairman, that is the point.
- 3 THE CHAIRMAN: And it's accepted by the witness.
- 4 MR QUINN: Yes. Is it always incumbent on the attending
- doctor to check the fluid balance chart before he would
- inject the patient with any anti-vomiting drugs?
- 7 A. You see, it is important whenever any doctor goes to see
- 8 a post-operative patient to understand how much patient
- has been able to take orally and, if she has vomited,
- 10 how many times and how much quantity.
- 11 MR QUINN: So in your practice, in your experience and in
- 12 your opinion, would you expect the nurses to relay the
- 13 information to the doctor, that is about coffee-ground
- 14 vomiting, and would you also expect --
- 15
- MR QUINN: Would you also expect, as a back-up, that the 16 doctor would check the balance sheet himself? 17
- 18 A. Of course, whenever there is any doctor called to see
- a patient post-operative, it is very important for the 19
- 20 doctor to make sure that he or she understands how much
- 21 fluid the patient has had, what type of fluid the
- 22 patient has had, any vomiting, how much urination, and
- 23 assess clinically to see whether the patient is
- 24 dehydrated or not.
- 25 MR QUINN: Finally, a doctor who's called to give an

- anti-emetic drug, would he also be required to carry out
- an examination before he would give that drug? 2
- 3 A. No, not necessarily, unless he's not given any
 - information and he has just been asked to give -- "This
 - patient has just vomited once, do you want to give any

anti-emetic?"

1

6

12

22

2

8

10

- 7 MR QUINN: Thank you very much.
- 8 THE CHAIRMAN: Mr Bhalla, can I just ask you one more thing
- as a development on that? It has been suggested to me
- 10 in the course of the evidence that there would be 11
 - nothing unusual about a child who'd had surgery vomiting regularly throughout the following day. In other words,
- 13 when Raychel was vomiting in the morning, in the
- 14 afternoon and in the evening, that would not be unusual; 15 do you agree with that?
- 16 A. No, it is unusual. Certainly, in a child getting only
- an appendicectomy done -- a simple, straightforward 17
- 18 appendicectomy -- the vomiting usually will occur for
- 19 the first few hours due to anaesthetic drugs.
- 20 THE CHAIRMAN: Okay. We're almost finished, Mr Bhalla.
- 21 When you say that the vomiting would usually occur
 - in the first few hours, if the operation ended about
- 1 am or 2 am -- and acknowledging that not every child 23
- 24 is the same -- when would you expect vomiting due to the
- 25 general anaesthetic to take place?

- 1 A. Maximum of 2 -- 3 to 4 hours. After that, the effect of anaesthesia will not cause any more vomiting. 2
- 3 THE CHAIRMAN: Because in Raychel's case, she did not vomit
- at all, according to all the information we have, until 4
- 5 8 am. And then her vomiting, which started at 8 am,
- 6 continued through the day and into the evening.
- 7 A. Yes.
- 8 THE CHAIRMAN: So does that raise a question for you about whether this was ever post-operative vomiting, since it
- 10 didn't start --
- 11 A. Definitely, yes. Definitely it is of concern that
- 12 something else is going on.
- 13 THE CHAIRMAN: Because --
- A. We have to find out what could be the cause. 14
- 15 THE CHAIRMAN: Because the time at which the vomiting
- 16 started was later than you would expect for
- 17 post-operative vomiting?
- 18 A. Yes. Absolutely.
- 19 THE CHAIRMAN: And then the duration of it is much greater?
- 20 A. Absolutely.
- 21 THE CHAIRMAN: Okay, thank you very much.
- 22 Mr Campbell, Mr Lavery? Okay.
- 23 Mr Bhalla, thank you very much for joining us today.
- 24 Unless there's anything you want to say before you
- 25 leave, your evidence is now complete.

- 1 A. Thank you very much, Mr Chairman. It has been
 - a pleasure and I'm very thankful that you've been able
- to arrange a video conference and that has not disturbed the routine here in our hospital. The whole hospital is 5 very thankful to you.

 - I think it's good that the inquiry is being made in order to make aware not only my colleagues, but nurses
 - and everybody that there should be good communication
 - between nurses and doctors. We have to -- we have
- learned the lesson that patients who are -- especially
- 11 children, if they are sick -- then they should h
- 12
 - attended more urgently by the senior people and taken
- care of. We have started CEPOD list here in our 13
- hospital as well. I have been persuading them and from 14
- 12 July we are starting CEPOD list. But of course, as 15
- 16 there are risks on leaving patients with appendicitis
- 17 off -- peritonitis, septicaemia, and especially girls
- 18 developing fertility problems -- it is important that we
- 19 continue to treat them urgently if we can.
- 20 THE CHAIRMAN: Just while you're on that topic, in
- 21 Macclesfield for post-operative children -- for
- 22 instance, for appendicectomies -- do you use
- Solution No. 18 as an IV fluid? 23
- 24 A. No. No, we have never used Solution No. 18 in this 25 hospital.

1	THE CHAIRMAN: What do you use?
2	A. We use most of the time either dextrose saline, which is
3	50 per cent dextrose, 50 per cent saline.
4	THE CHAIRMAN: Okay.
5	A. And again, we monitor whether the patient is vomiting,
6	if it is vomiting, then we do normal saline at times.
7	THE CHAIRMAN: Okay. Thank you very much, Mr Bhalla. We're
8	going to cut the link now.
9	A. Thank you very much.
10	(The video link was terminated)
11	THE CHAIRMAN: We'll take a break for 15 minutes and then
12	start with Mr Gilliland.
13	(11.40 am)
14	(A short break)
15	(12.08 pm)
16	MR ROBERT GILLILAND (called)
17	Questions from MS ANYADIKE-DANES
18	MS ANYADIKE-DANES: Mr Gilliland, do you have there with you
19	your curriculum vitae?
20	A. Yes.
21	Q. Mr Gilliland, you have made a number of statements. If
22	I go through them, just to confirm matters. You made
23	a statement for the Trust dated 30 January 2002, which
24	was your first statement.

1 Q. The reference for that is 012-017-120. Then you had a deposition to coroner and attended the inquest. That 2 was 5 February 2003. One sees the reference is 012-038-176. And you have made now three statements for the inquiry. 6 A. That's correct. 7 Q. The series is 044: your first statement to the inquiry 8 was 1 July 2005; the second was 13 July 2012; and your third, 29 January 2013. Subject to anything that you 9 10 wish to say during your oral evidence, do you adopt all 11 of those statements as being accurate? 12 A. Yes. 13 Q. Thank you. If we go to your CV, it starts at 14 317-005-001, but perhaps we can pull up together 002 and 15 003. We can see from there that you qualified 16 in June 1983 --17 A. That's correct. 18 Q. -- and that you had three months as a JHO in the neurosurgical unit at the Royal Victoria Hospital. That 19 20 would be between November 1983 and January 1984. Within 21 that, you had three months in the neurosurgical unit; is 22 that correct?

- 23 A. That's the exact dates.
- 24~ Q. And then from August 1984 to July 1985, you were an SHO
- 25 in general surgery in Accident & Emergency in the

- 1 Downe Hospital. And whilst you were there, you dealt
- 2 with both emergency and elective surgical paediatric
- 3 cases; is that correct?
- 4 A. That is correct.
- 5~ Q. You then had a period of time as an SHO dealing with
- 6 paediatric surgery at the Children's Hospital
- 7 between August 1986 and January 1987; is that right?
- 8 A. Correct.
- 9 Q. August 1987 to July 1988, you had a period of time as
- 10 an SHO in Ballymena and it says "in lieu of registrar".
- 11 Does that mean you were essentially acting up as
- 12 a registrar?
- A. Yes. You didn't have a registrar number at that stage,
 you hadn't been appointed centrally as a registrar, but
- 14 you hadn't been appointed centrally as a reg
- 15 you were acting in the registrar grade.
- 16 Q. Yes. Then you had a further period of time at the
- 17 Children's Hospital between August 1991 and January 1992
- 18 as a registrar in paediatric surgery.
- 19 A. Yes.
- 20 Q. Then in August 1994 to July 1995, you came then to
- 21 Altnagelvin as a senior registrar in general surgery.
- 22 A. That's correct.
- 23 $\,$ Q. And you were appointed a consultant colorectal and
- 24 general surgeon in Altnagelvin in August 1997?
- 25 A. Correct, yes.

- 1 Q. And you have been a consultant in Altnagelvin since
- 2 then?
- 3 A. No.
- 4 Q. Except for 2008; is that right?
- 5 A. No, I was appointed to the Ulster Hospital in 2008.
- 6 Q. Yes, sorry, I beg your pardon. So you're now with the 7 Ulster Hospital; is that right?
- 8 A. That's correct, yes.
- 9 Q. We also see from your CV, if we go to 006 of it, that
- 10 you've really been guite heavily involved in teaching; 11 would that be a fair way of characterising it?
- 12 A. Yes.
- Q. But before I ask you a little bit about that teaching,
 in all the time that you had periods of experience or
- 15 were working at the Children's Hospital, did you ever 16 hear of Adam?
- A. No, I didn't. I was working in the Children's Hospital
 before Adam Strain died as far as I can recollect.
- Q. Yes. Why I asked you that is I assumed that you would
 have established some professional relationships with
- 21 the surgeons there and the anaesthetists. But it was
- 22 never drawn to your attention that they'd had a death 23 like that?
- 24 A. No, no.
- 25 Q. Did you do a period of time in surgery there?

1	A.	Yes.
2	Q.	In fact, when did you first hear about Adam's case?
3	A.	I don't believe I heard about Adam's case until some
4		time in and around the television programme that went
5		out in the UTV, which I think was 2004/2005.
б	Q.	2004.
7	A.	Okay.
8	Q.	Thank you. So now then if I ask you about the
9		teaching
10	THE	CHAIRMAN: Just before you do, on page 004, if we could
11		go back to that, you had 18 months in Florida,
12		Mr Gilliland.
13	A.	Yes.
14	THE	CHAIRMAN: Do I take it that it's competitive to get to
15		the Cleveland Clinic?
16	A.	It would be seen as a very prestigious job.
17	THE	CHAIRMAN: What was the specific area or interest that
18		made you want to go to the Cleveland Clinic?
19	A.	They are a world renowned colorectal unit and ${\ensuremath{\mathbb I}}$ was
20		working in the colorectal surgery unit there.
21	MS	ANYADIKE-DANES: Is that what you wanted to come back to
22		Northern Ireland to work in?
23	A.	Yes, I had been effectively training in colorectal

- surgery since 1991 or thereabouts. 24
- 25 Q. And going to such a specialist unit would assist those

ambitions?

1

13

- 2 A. It would, yes
- 3 Q. And ultimately that's what you achieve when you come to Altnagelvin as a consultant in August 1997.
- 5 A. That's correct.
- 6 Q. If I can ask you about the teaching: in large part, correct me if I'm wrong, it seems to have been conducted
- 8 at Altnagelvin; is that right?
- 9 A. The teaching, yes. I was also responsible for surgical 10
 - training for a large part of the last decade.
- 11 Q. Yes. Maybe during governance we will ask you some 12 questions about the teaching, training and induction
 - that is offered at Altnagelvin and what role you may or
- 14 may not have had in relation to that, but I do it now to
- 15 note that you've had that interest and that involvement.
- 16 Is that a particular interest of yours?
- 17 A. Yes, I'd always been interested in teaching and
- training. I suppose that was due to people who had been 18 19 responsible for training me and I'd admired them and it
- 20 was something I always wanted to be involved with.
- 21 O. Can I ask you if you held any -- it sounds pejorative to
- 22 say "administrative", but if you held any positions
- 23 within the Trust or the hospital while you were at
- 24 Altnagelvin? 25 A. Such as?

3

16

- 1 Q. Were you ever a --
- 2 THE CHAIRMAN: Director of surgery?
- 3 A. No, I was never involved in management at that level.
- 4 THE CHAIRMAN: I think it's more management than
- 5 administrative.
- 6 MS ANYADIKE-DANES: Yes.
- 7 A. You'll see from the CV that I determined that I was
- 8 going to be involved in teaching and training rather
- 9 than in the management side or the administrative side.
- 10 Q. So you took your contribution to further matters forward
- 11 through teaching and training rather than through
- 12 management?
- 13 A. Absolutely correct, yes.
- 14 Q. Can I ask you now about the role of the different
- grades, if I can call it that, as they existed 15
- 16 in June 2001? I'm going to, unless I say
- 17 differently, confine all my questions to what was the
- 18 position as at that time or prior to that time because
- 19 that's really the period of time that we're concerned
- 20 with in terms of Raychel's care.
- 21 So as at 2001, in terms of the surgeons, can you
- 22 help us by explaining what the roles were of the
- 23 different grades? If we start first with the JHO. So
- 24 far as you were concerned in 2001, what was the role of
- 25 the JHO?

- 1 A. The JHOs were pre-registration, they were still, to
- a certain extent, under the auspices of the university. 2
 - They came to the hospital and they worked for a year to
- gain experience before they were fully registered with 4
- 5 the GMC. That experience would largely be under the
 - direct supervision of their consultants and their more
 - senior junior staff. And they would be doing, as
- 8 I think someone has already said, predominantly
- task-orientated duties. They would be clerking in
- 10 patients, writing up drug kardexes, prescribing fluids,
- 11 prescribing routine medications. But they would also be
- 12 seeing and assessing patients. That would be all part 13 of the learning process.
- 14 Q. I think you were at the back of the chamber when 15 Mr Bhalla was giving his evidence. Did you have an
 - opportunity to hear his evidence?
- 17 A. Only the last few minutes.
- 18 Q. Ah, I see. I asked him as well a question and his view 19 was that the JHOs were trainees still and what they had
- to do they did under the supervision and guidance of 20
- 21 a more senior colleague, usually the SHO, but sometimes 22 the registrar.
- 23 A. That would seem reasonable. They're all trainees until
- 24 consultants.
- 25 Q. Yes, but particularly trainees as JHOs though.

1	A.	They're	pre-registration,	yes.	They're	not	fully
---	----	---------	-------------------	------	---------	-----	-------

- 2 registered with the GMC.
- 3 Q. When you were giving that list of things that, in your
- view, JHOs might be involved in, you cited prescribing
- fluids. We had asked a question of the JHOs involved in
- Raychel's care. From Dr Devlin's point of view, they didn't prescribe fluids.
- 8 A. They didn't prescribe fluids in paediatrics or they
- didn't prescribe fluids full stop?
- 10 Q. We were confining ourselves to paediatrics. Can you 11 help with that?
- 12 A. Sure. I think their experience would be that they would
- 13 often not have to prescribe fluids for children.
- 14 Firstly, there would have been very few surgical
- 15 children admitted to the hospital, so there would be
- a limited number, very few of them, that would require 16
- fluids much beyond 12 hours. And if there was fluids 17
- that were required, as we've already heard, the practice 18
- 19 was often that rather than call a surgeon or wait for
- 20 a surgeon to arrive, because they would be busy
- 21 elsewhere on other wards, there were paediatric staff
- available on the ward and the nursing staff would often 22
- ask the paediatric staff to prescribe. 23
- 24 Q. Yes, that might be why they didn't do it very often
- but -- and I will stand corrected -- Dr Devlin didn't

- understand that as something that JHOs did. Prescribing
- is just not one of those things he thought they did. 2
- 3 A. They would prescribe IV fluids, yes.

8

12

13

14

21

- 4 Q. The other thing is that we had asked a similar sort of
- question when we were trying to see who was responsible
 - for what in terms of prescribing fluids and, at that
- stage, we were looking at the responsibilities in terms
- of the particular discipline as opposed to the grade.
- When we asked that question of Mr Zawislak, his view
- 10 was that he wouldn't regard himself as prescribing
- 11 IV fluids for a paediatric patient. He wouldn't want to
 - do that; if it had to be done, he would get in touch
 - with a paediatrician because he didn't regard himself as
 - somebody who should be doing that. Are you still saying
- 15 that's something JHOs could do for paediatric patients? A. I would say that in terms of the lines of 16
- responsibility, surgical patients in the paediatric ward 17
- were under a surgical team, and the lines of that 18
- responsibility would effectively end with the JHO and 19
- 20 they would be the ones who would often be asked to
- prescribe. If they didn't feel competent to do, that 22
- would be a different issue. They would be able to ask either a more senior member of the surgical team or they 23
- 24
- could ask for advice from the paediatrics. But in terms
- 25 of whose responsibility overall it was, my belief was

- that ongoing prescription of fluids in surgical patients
- would be the responsibility of the surgical team. 2
- 3 Q. Ongoing might be slightly different. There might be
- 4 a difference between being asked to write a fresh
- 5 prescription, which is to assess a child's needs and
- 6 write up a prescription, as opposed to fluids having
- already been administered and somebody wants another bag
- 8 put up, which requires, all things being equal, a repeat
- prescription because each bag, as I understand it,
- 10 requires its open prescription.
- 11 A. Each bag requires its own prescription.
- 12 Q. So do you see a distinction between those two
- prescribing roles if I can put it that way? 13
- A. A JHO would, I would imagine, very rarely be asked to 14
- 15 make the first prescription for a child because, as
- 16 we've already seen, any patient is normally first seen
- 17 by a JHO or a registrar in surgery.
- 18 THE CHAIRMAN: Sorry, I think you said --
- 19 A. JHO. SHO, I beg your pardon. An SHO or registrar in
- 20 surgery. And therefore, they would be the ones who
- 21 would be most likely to write up the first prescription
- 22 MS ANYADIKE-DANES: But even if they're the ones most likely
- to, I just want to be clear about what you thought their 23
- role might be. There's a difference between somebody 24
- doing something rarely and somebody not doing something 25

- because that particular thing is not regarded within
- their area of competence. In terms of the fresh 2
- prescription, is that something that you think a JHO
- ought to do, albeit that they may be required to do it very infrequently?
- 6 THE CHAIRMAN: Sorry, when you say "a fresh prescription",
 - do you mean the initial prescription or the repeat prescription?
- MS ANYADIKE-DANES: By "fresh", I meant the initial 10
 - prescription.

5

8

11 A. I don't think there would ever be a time whenever a JHO 12 would be called upon to do that fresh prescription

- because the emergency patients would be seen by the SHO 13 14 and registrar.
- 15 Q. So is a better way just to say that's not part of what 16 you expect a JHO to be doing?
- 17 A. It would be unusual for them to do so.
- 18 THE CHAIRMAN: Because it doesn't arise?
- 19 A. Because it doesn't arise.
- 20 MS ANYADIKE-DANES: And in terms of a repeat prescription
- 21 if I can use that terminology, if they were doing that,
- 22 is that something that you think they should do under
- the supervision of an SHO or inform an SHO that they 23
- 24 were doing that?
- 25 A. That would depend on their level of competence. If they

- felt competent to do that, if they knew how to prescribe 1
- for children, then it would be reasonable for them to do 2
- that. But if they didn't feel competent, then they
- would be duty-bound to ask.
- 5 Q. I think, Mr Gilliland, people can understand that if you
- feel out of your comfort zone, then you tell someone
- about it. The problem is if you're not terribly
- 8 experienced, you might not realise that there's
- something you shouldn't really be doing because you
- 10 might not have enough knowledge and experience to
- 11 recognise your limitations, if I can put it that way.
- 12 A. Absolutely, but I think a JHO would realise if they were
- 13 asked to prescribe fluids and they had no idea how to do
- 14 that at all, they'd no idea of the formula, they'd
- 15 certainly ask for help on that.
- 16 Q. Both JHOs that we have asked about it, they have all
- known what the formula is, that there is a formula and 17
- they know how it relates in terms of weight and so forth 18
- and how you calculate it. So the question I am asking 19
- 20 you is: on the basis that they know how to calculate it.
- 21 is nonetheless writing up a repeat prescription
- 22 something that you think a JHO should do by themselves
- or is it something that, if they do do it by themselves, 23
- 24 should they notify their SHO, "This is what I have
- 25 done"?

- 1 A. In 2001, I do not think that the JHOs, if they felt
- competent to do it, would have needed to inform the SHO. 2
- 3 Q. Thank you.

13

- 4 THE CHAIRMAN: And can I take it that the level of
 - competence which you would expect the JHO to have would
 - be greater as the months went on, so that the JHO who
 - arrives in August might not have the competence to do
 - it -- and each one will be different and more or less
- competent -- but by the following June/July, you would be a bit surprised if they wouldn't prescribe a repeat
- fluid bag?
- 12 A. Again, as you've said, I think that depends on the
 - experience they've gained through the year.
- 14 MS ANYADIKE-DANES: Is it correct to say that when the JHOs 15 have their year, they have a sort of split rotation? So
- for example, for the JHOs that we've seen, they've had 16
- a split between surgery and between general medicine. 17
- 18 A. That's correct, six months each.
- 19 Q. And within surgery, I think both of them said they would
- 20 have had really guite limited exposure to paediatric 21 surgery
- 22 A. I think both of them did stints within urology, which
- 23 really wouldn't have any particular paediatric
- 24 experience.
- 25 Q. So even at the end of their six months of surgery, if I

- can put it that way, they may still be relatively inexperienced in relation to paediatric patients? 2
- 3 A. They may well be.
- 4 0. Thank you. So when we had asked the JHOs -- and by that
- 5 I mean Mr Devlin and Mr Curran -- about how they saw
- 6 their roles, Mr Devlin saw his role very much as acting
- on direction, if I can put it that way, and I think
- 8 Mr Curran was very much the same. And "by direction",
- that included not just the more senior colleagues, but
- 10 in that they included the nurses, in relation to
- 11 paediatric matters; would you accept that?
- 12 A. Yes, that would be standard practice. There are
- experienced nurses both in adult and paediatric wards 13 and JHOs often take advice from them. 14
- 15 Q. Yes. And the element of acting very much on direction,
- 16 would you accept that, that when they're dealing with
- 17 the patients on Ward 6, the paediatric ward, that may be 18 the case?
- 19 A. Well, looking back to my own experience I think that is 20
- the case: we were directed when we were JHOs by the
- 21
- 22 Q. So that's the JHOs. What do you see as the role or
- 23 principal role of the SHOs?
- 24 A. The SHOs are the first grade of the training scheme.
- Their role would be again to -- they would be attached 25

- to a surgical team, they would be responsible for seeing
- the patients that belonged to that surgical team, they 2
- would be responsible for, when they were on call, seeing
- patients in the Accident & Emergency department or
- 5 patients who were being admitted by the general
- practitioners. They would be the first port of call, as
- it were. Furthermore, during the day, they would be
- involved in assisting in surgery and also performing
- some surgery. They would be at the outpatient clinic.
- They would be very much part of the surgical team.
- 11 Q. If they hadn't already had some experience of
 - paediatrics, would it be possible for an SHO at
 - Altnagelvin -- a surgical SHO, of course, at
- Altnagelvin -- to have still quite limited experience of 14
- 15 paediatric patients?
- 16 A. Yes, I think that's possible.
- 17 Q. And that's simply because, is it, from the surgical
- 18 point of view, the overwhelming work involves adults? 19 A. Most of the work is adult.
- 20 Q. In fact, I think the SHOs who have been giving evidence in relation to Raychel's care have been Mr Makar and 21
- 22 then Mr Zafar, during the day of Friday, which turned
- 23 out to be quite an important day in Raychel's admission.
- His evidence was that he had actually very limited 24
- 25 experience in paediatric cases and that wouldn't be any
 - 84

1	surprise	to	vou?

- 2 A. No, I think that's correct.
- 3 Q. So does that mean, given that possibility, that even
- though they are SHOs, one still needs some sort of
- system whereby they can have guidance and overview of their work?
- 7 A. Yes. That is correct.
- 8 0. And that may take us to the registrars, who are next up
- the chain, if I can put it that way --
- 10 A. Could I just say one other thing about the SHO grade?
- 11 O. Yes.

- 12 A. Because I think this is important. The SHOs, the two
- 13 you've mentioned, were both very experienced surgeons by
- 14 the time they were appointed to Altnagelvin. One had
- 15 a considerable amount of general surgical experience,
- the other had both general surgical experience and 16
- cardiac experience. And this was typical of the people 17 who were being appointed to Altnagelvin at that time.
- 19 Both gentlemen came from overseas, therefore it would be
- 20 impossible for them to obtain a registrar grade without
- 21 having gone through an SHO training scheme. There were
- 22 certain criteria that they had to meet before they would
- 23 even be eligible for appointment to registrar, such as
- passing the Basic Surgical Skills course, the Critical 24
- 25 Care of the Surgical Patient course, the ATLS course,

85

- et cetera. So both were quite experienced. Some of
- them had more experience than many second or third year registrars today.
- 4 THE CHAIRMAN: So in effect, when they came here, they had to step back to a lower level than the level they'd been working at in their home countries?
- A. As far as I can recall, both those gentlemen had been
- registrars, and yes, they had to step back. They
- realised before they came to the United Kingdom that
- 10 that would be what they would have to do.
- 11 THE CHAIRMAN: And that's not because a registrar in India
- 12 or Egypt is inferior to a UK registrar, it's that the UK
- 13 training system doesn't allow you, in crude terms, to
- 14 become a registrar unless you've been a UK SHO?
- 15 A. It didn't put that absolute stricture on it, but 16
 - it would be almost impossible for someone to be
- competitive at interview having not gone through at least some SHO training within the UK. 18
- 19 MS ANYADIKE-DANES: So what you're really saying is that
- 20 their SHO grade might belie their surgical experience?
- 21 A Absolutely

1

2

6

8

17

- 22 Q. But in this case, they may have quite significant
- surgical experience, but be relatively inexperienced in 23
- 24 paediatrics? That's a possibility?
- 25 A. That's a possibility.

86

- 1 O. Yes. And if that's the case, then those perhaps
- infrequent patients that fell to them to address, that 2
- may be an area where they would require more quidance 3
- and support than if they were just going about their 4
- 5 normal adult surgical duties?
- 6 A. If they felt they required support, yes.
- 7 Q. I wasn't asking it so much as if they felt, but that's
- 8 something surely that the surgical directorate
- recognised, that that might be the case.
- 10 A. I think whenever someone comes to work in the hospital,
- 11 you expect from them a certain level of competence and
- 12 a certain level of professional performance. And
- therefore, all doctors operate under the Good Medical 13
- Practice guidelines and therefore if they felt that they 14
- 15 weren't competent at a particular stage or a particular
- 16 task or a particular patient, they would know that they 17 would have to ask.
- 18 Q. Yes. And then the registrar level -- I think you were 19 going on to help me.
- 20 THE CHAIRMAN: The other point which I think supports that,
- 21 Mr Gilliland, is that these doctors have said that when
- 22 they arrived they were, in effect, assessed -- perhaps
- 23 informally -- in their first few weeks for satisfaction
- about their level of competence and performance. 24
- 25 A. Yes, there wasn't any official or formal assessment, but

- it was done informally through many settings. You'd 1
- have the opportunity to review the SHOs' decision-making 2
- and management plans on a ward round the night after they had been on call for taking. You'd see the
- performance on the ward, you would have been able to see
- how they would perform in the operating theatre. Not
- necessarily doing each of the tasks, but you would get an impression of their general ability. You'd also see
- them in outpatients, where they would be encouraged to
- ask about any patient that they didn't understand, and
- I made it a point of actually reading all of their
- 11 12 letters to ensure that their care was appropriate.
- 13 THE CHAIRMAN: So you fairly quickly get a reasonably good picture that somebody does or does not know what he's 14
- 16 A. Correct.
- 17 MS ANYADIKE-DANES: I think the chairman had referred, when
- 18 we were asking those sorts of questions to the people
- 19 involved, that it's a two-way street, I think the
- 20 chairman had characterised it as. They're having an
 - opportunity to demonstrate to you, albeit not in
- 22 a formal way, their skills and competence and they're
- 23 also having an opportunity to receive from you
- information as to how things are done in Altnagelvin and 24
- 25 the standard or way in which you expect them to be done;

15 doing?

8

10

- 1 would that be fair?
- 2 A. That would be a normal training system.
- 3 Q. And that's quite an important part of what you're trying
- 4 to convey to them.
- 5 A. Yes.
- 6~ Q. Because as you say, they're coming from different
- 7 places, there's different ways of doing things and
- 8 presumably, in Altnagelvin, there are things that you
- 9 wish to have done in a particular way and that's
- 10 something that you impart to them or there may be things
- 11 you want done in particular ways?
- 12 A. There may be.
- 13 $\,$ Q. For example, you may have different standards of record
- 14 keeping or you may want handovers done in certain sorts
- 15 of ways, that sort of thing. You may expect attendance
- 16 at lectures and seminars, which may not have been
- 17 expected in other institutions. Those are the sorts of
- 18 things you would convey to them.
- 19 A. Some of those things. I think record keeping is
- 20 something that would be across all hospitals -- should
 21 be at a certain standard
- 22 Q. Well, in the induction programme -- not you personally,
- 23 but Altnagelvin -- made available its own document on
- 24 case notes, which presumably it wanted to do to make
- 25 sure that there is a common level of maintaining the

- case notes. But that's perhaps a matter that we'll deal with more in governance.
- In any event, they are assessed and information is
- conveyed to them, but if we go to what you actually expect registrars to do, what's expected of a registrar.
- capeter registrars to do, what is expected of a registrar.
- 6 A. A registrar is there in order to be trained so we would 7 expect them take more responsibility in the operating
 - theatre. We would expect them to be supervised to do
 - more complex procedures and learn in that way. We'd
 - expect them to effectively be responsible for the
- 11 running of the ward under the guidance of the
 - consultant. We would expect them to attend outpatients
 - and we would expect them to be part of the on-call rota
- 14 at night where they would be effectively the second 15 tier.
- 16 Q. And for the consultants, they're sort of at the apex of 17 this structure. What is expected of them?
- 18 A. The consultant is there to ensure that all of those
- 19 structures are in place, to ensure that care is 20 delivered to the highest standard that it can be. He's
- 21 there also to teach and train all of those people who
 - there also to teach and train all of those people who
- 22 are underneath him.

1

2

8

10

12

13

- 23 Q. The consultant has the ultimate responsibility for the24 care and treatment of the patient for whom they are the
- 24 care and treatment of the patient for whom they are the 25 named consultant; is that right?

90

- 1 A. That is correct.
- 2 Q. So to some extent, they need to be attuned to what is
- 3 happening so that they can ensure they discharge that
- 4 responsibility?
- 5 A. That's why those structures are in place. I've made
- ${\rm 6}$ $\,$ it -- we need to be assured that there was a structure
- 7 in place whereby people could be reviewed on a regular
- 8 basis, usually in the morning, or further -- later
- 9 during the day if required. And I need to be informed 10 of all of those things.
- 11 Q. So that's the structure within the surgical team, if I 12 can put it that way, but when the surgical team has
- 13 paediatric patients, those patients are in not an
- 14 exclusively surgical ward, they're on a mixed ward
- 15 where, in large part, the patients are actually just
- 16 general medical patients; is that correct?
- 17 A. That's correct.
- 18 $\,$ Q. So what is the interaction between the surgeons who have
- 19 their paediatric patients on that ward and the
- 20 paediatricians who are there dealing with the general
- 21 medical patients?
- 22 A. There isn't any specific structure. The two patients
- 23 are separate, so the surgeons would look after their
- 24 patients, paediatricians would look after their
- 25 patients. But if there are areas of concern, there were

- very open lines of communication between the surgical
- 2 team and the paediatric team for advice from the
- 3 paediatricians.

5

8

13

- 4 $\,$ Q. The evidence that we have received suggests that the
- paediatricians are more readily available on that ward
- because they don't have the sort of commitments that
- take the surgeons away. Primarily, of course, they're
- not attending theatre, which may take up a large part of
- the surgeon's time. So they're more readily accessible.
- 10 A. And also they don't have adult wards to look after.
- Q. And these patients may be relatively small minority of
 the total patients that the surgeons are dealing with.
 - That being the case, within the surgical team, how did
- 14 you try and ensure that those surgical paediatric
- 15 patients and the junior doctors dealing with them have 16 the requisite degree of oversight?
- 17 A. Well, in terms of the oversight, that oversight would
- 18 fall to the consultant. Therefore they would need to be 19 assured that if someone was going to see a patient on
- 20 the paediatric ward, that they would be able to make an
- 21 assessment of that patient appropriately and, if not, or
- 22 if they had any concerns, feedback to either their
- 23 registrar or, if that was not appropriate, to the
- 24 consultant.
- 25 Q. Did it mean to some extent you had to rely on your

a structure on a regular

- 1 paediatric colleagues, if you like, to be able to
- 2 respond to the needs of one of your patients when the
- 3 surgical team is tied up?
- 4 A. There wasn't any formal --
- 5 Q. No.
- 6 A. -- protocol for that. That seemed to be a practice that 7 had developed within Ward 6. And in that, I don't think
- 8 that was particularly unusual for many other paediatric
- 9 units where the paediatricians and their junior staff
- 10 would largely be resident on the ward and the surgeons
- 11 and their junior staff would not be.
- 12 Q. Yes, but if that is a practice that developed then it
- 13 does mean, does it not, that you have to ensure that
- 14 there are good lines of communication, if I can put it
- 15 that way, between the paediatricians and the surgeons
- 16 because sometimes the paediatricians may be doing things
- 17 in relation to one of their patients when they're not
- 18 there for very good reason, and they would need to know
- 19 what's happening so they can maintain a sort of
- 20 continuity of care and knowledge about their patient?
- A. I'm sorry, could you repeat that? I got a little lost
 there, sorry.
- 23 Q. I said: because you've recognised that there was
- 24 a practice that the paediatricians did sometimes get
- 25 called upon to do things in relation to your surgical
 - 93

- paediatric patients, that that would mean that you
- needed good communications between the two sides to
- ensure continuity of care.

2

9

- A. There was, as far as I'm aware, very good communications
 between the two sides.
- 6 Q. I'm not saying that there wasn't; I'm saying that you 7 would need to ensure there was.
- 8 A. I suppose it's hard to ensure there was apart from
 - knowing the relationships that were present already.
- 10 Q. Record keeping might be important to make sure that when 11 you look at the records you can see clearly what people
- 12 have done and why if it is the case that other people
- 13 are going to be asked to do things in relation to your
- 14 patient. That might be one way of ensuring it; is that 15 correct?
- 16 A. Record keeping, regardless of who makes the record, is 17 important.
- Q. Yes. It might be particularly so when they're not part
 of your team.
- 20 THE CHAIRMAN: I've got the point. I think record keeping's 21 generally important, full stop.
- 22 MS ANYADIKE-DANES: Yes.
- 23 Then can I ask you about the knowledge of
- 24 hyponatraemia? 012-038-178. This is the handwritten
- 25 part of your evidence to the coroner at the inquest.

1	The last two lines:	1		points and hand write them at the end of your
2	"I only became aware of hyponatraemia after the	2		deposition, very often not including the question. And
3	death of Raychel."	3		so that's what we're looking at here. But what we have
4	Do you remember saying that?	4		is a contemporaneous note taken by counsel who attended,
5	A. I don't remember saying it, but it is recorded.	5		and that has been typed up. The reference for it, at
6	Q. Well, is that the case?	6		least the particular part dealing with this, is
7	A. Yes, that's absolutely the case because this was in the	7		064-002-013.
8	context of a child who'd died from dilutional	8		You can see the final paragraph. This is a series
9	hyponatraemia, which was a scenario or a condition that	9		of questions that had been put to you by counsel for the
10	I had not seen at any stage during my training or	10		family. Where you refer to hyponatraemia is in that
11	subsequently as a consultant. It would be	11		final paragraph:
12	THE CHAIRMAN: Sorry. Does that mean, Mr Gilliland, that	12		"Mr Gilliland was asked whether the chart [I presume
13	I should read that as:	13		that is the fluid balance chart] would have suggested
14	"I only became aware of dilutional hyponatraemia	14		a risk of sodium deficiency. In reply he said this risk
15	after the death of Raychel"?	15		of hyponatraemia is not widely known and he was not
16	A. I presume that that was the question I was asked.	16		aware of it until after Raychel's death. Like
17	THE CHAIRMAN: Or does it mean: only became aware that	17		Dr Nesbitt, he agreed that the literature was freely
18	dilutional hyponatraemia could lead to a death after the	18		available on the subject, but was adamant that it was an
19	death of Raychel?	19		impossible task to review all the journals to become
20	A. No, I think you should read it as: I only became aware	20		informed of it, though he did recognise that vomiting
21	of dilutional hyponatraemia in children following the	21		lead to depleted sodium levels, but added most surgeons
22	death of Raychel.	22		were unaware of the risk of hyponatraemia."
23	MS ANYADIKE-DANES: Well, we have the benefit of counsel's	23		Does that help you explain better what it was that
24	typed-up note from the inquest. The way the evidence	24		you were saying you didn't know about?
25	worked, the coroner would typically distil important	25	7	A. Yes. I'm still saying that the problem of dilutional
	95			96

- hyponatraemia in children was not widely recognised. 1
- I certainly hadn't heard of it. I hadn't heard of 2
- either of the two journals that are probably referred to
- in that. I think that very few surgeons at that time
- were aware of the risk of dilutional hyponatraemia, but
- all surgeons would have been aware of hyponatraemia.
- All surgeons would have understood that hyponatraemia
- 8 was a serum sodium of less than 135.
- 9 Q. Well, Mr Bhalla's evidence is that he personally was
- 10 very much aware of that as at 2001. He gave evidence on
- 11 it and he explained the mechanics and why one would
- 12 recognise that dilutional hyponatraemia could result.
- 13 You would accept the mechanics of it, would you not,
- 14 that if you infuse a significant amount of low-sodium
- 15 fluid that you'll end up depleting the sodium and in
- that way diluting sodium in the body? 16
- A. Not normally, no. 17
- Q. What would happen? 18
- 19 A. Solution No. 18 was the usual solution given to
- 20 children, so just by infusing that on its own would not
- 21 need to sodium depletion
- 22 Q. Even if you infused a considerable amount in a very
- 23 short period of time?
- 24 A. It depends again what one means by a considerable
- amount. If you infuse a really excessive amount,

- that is possible. But the case here was that the
- 2 dilution was being caused by water retention.
- 3 Q. If we move away from the case here so we understand what
- you understood about hyponatraemia at the time. Would
- you have understood, if you had infused a considerable
- amount of low-sodium fluid over a relatively short
- period of time -- forget Raychel for the minute, just
- that hypothetical situation -- would you have recognised
- that that would lead to dilutional hyponatraemia?
- 10 A. I think it depends what you mean by an excessive amount.
- 11 0. Far more than maintenance level.
- 12 Far more than maintenance level?
- 13

6

- 14 A. Far more than maintenance level, yes.
- 15 You'd have realised that?
- A. I think one would have realised that was a possibility, 16
- but it's certainly not something I had ever seen. 17
- 18 Q. I'm trying to make sure that you don't deny the
- mechanics of how that might happen. What you're saying 19 20 is. I take it, that you didn't have any familiarity with
- 21 it yourself --
- 22 A. That's correct.
- 23 Q. -- but you'd understand that that is something that
- 24 could result?

1

2

6

12

13

25 A. I would understand that -- I didn't understand then, but

98

- I would understand now that infusing No. 18 Solution in
- the presence of inappropriate ADH secretion can cause 2
- dilution. 3
- 4 0. I haven't got to adding the extra dimension of
- 5 inappropriate antidiuretic response. If we just keep
- 6 with the low-sodium fluid: the way I put it to you, "far
- more than maintenance levels", if that's done over
- 8 a relatively short period of time, I was asking you if

you would have recognised, in 2001, that that could lead 10 to dilutional hyponatraemia.

11 A. I suspect I wouldn't have even thought about it in 2001 12 because giving a huge excess of fluid to a child

wouldn't have happened. We're really talking about 13

a large quantity here. 14

- 15 Q. Okay. Then if we add the other factor of SIADH, would
- 16 you have recognised, if somebody had simply put the
- 17 proposition to you, that if that response has happened
- 18 and you infuse Solution No. 18, a low-sodium solution,
- 19 over and above the maintenance levels required for the
- child, that that could lead to a depletion of the sodium 20 21 in their body?
- 22 A. I don't think I would have fully recognised that at that 23 time.
- 24 Q. You wouldn't have known that?
- 25 A. I don't think I would -- I've never seen that and

- I don't think I would have fully recognised that at that time.
- 3 Q. Conceptually, you wouldn't have seen that that is something that could result?
- 5 A. Conceptually, maybe, but it's not something that I would have given any consideration to at that time.
- THE CHAIRMAN: I think the problem is moving between the 8 theoretical and the actual. Because your question a few
- moments ago, Ms Anyadike-Danes was, "If someone had
- 10 simply put the proposition to you". What I gather from
- 11 what you're saying, Mr Gilliland, is: who would ever put
 - that proposition to me because it's self-evident that
 - a child should not be given far too much fluid.
- 14 A. That is correct.
- 15 MS ANYADIKE-DANES: Mr Chairman, who does put the
- 16 proposition is that that's what, as we understand from
- 17 Mr Ledwith's report, background report, students would
- 18 be taught, that that is how the body would respond.
- 19 That's why I'm asking you that. He has explained that,
- 20 in teaching, you would be taught about electrolyte
- 21 imbalance, you would be taught about hypotonic
- 22 solutions, you'd be taught about SIADH and one would
- 23 understand the mechanics of that, that if that were to
- happen that would be the result, and that's part of your 24
- 25 teaching. Whether you actually had experience of a case

- 1 like that happening in your practice is a different
- 2 question and that's why I'm putting it to you: is it
- 3 that you didn't even appreciate such a thing could
- 4 happen or is it simply that you're saying, "Of course
- 5 I know that could happen, I'm just saying I'd never seen
- 6 it"? I'm trying to find out which side you're on.
- 7 A. Well, the teaching that trauma or the metabolic response
- 8 to surgery can cause a rise in ADH was known. But again
- 9 I don't recall at any point during my training being
- 10 given advice about significantly reducing fluids in
- 11 response to that and the severe dilutional hyponatraemia
- 12 that we've seen in this case is not something that I had
- 13 ever been taught about or experienced.
- 14 Q. Let's take the first proposition you made. You're
- 15 saying that in your training that you didn't have advice
- 16 or maybe even appreciate that the response to the
- 17 possibility of SIADH could be to reduce fluids
- 18 afterwards. You didn't appreciate that.
- 19 A. That was not, as far as I'm aware, standard teaching at
- 20 that time. Would you like me to expand on that?
- 21 THE CHAIRMAN: Yes, please.
- 22 A. You do look a little ...
- 23 THE CHAIRMAN: Please do.
- 24 A. Sure. I think most surgeons, certainly most surgeons
- 25 who would have done their fellowship examination, would

- understand that following surgery you can get a rise in
- 2 ADH. But there wasn't a practice of reducing fluids
- post-operatively really until the past decade in adults,
- largely due to the work of Henrik Kehlet in enhanced
- recovery. So surgeons, whilst they understood that
- there was an ADH response, I don't recall ever being
- taught to -- nor do I ever recall actually reducing
- fluids, certainly in adults, and I certainly don't
- 9 remember any specific teaching during my postgraduate 10 years about reducing fluids in children in response to
- 11 an ADH rise.

1

8

- 12 THE CHAIRMAN: One of the issues we'll get to this afternoon 13 in Raychel's case is the proposition that after she came
- 14 out of surgery, that in recognition of the possibility
- 15 of SIADH, the fluids should have been reduced to
- 16 something below the preoperative formula in the region
 - of 20 per cent.
- 18 A. Yes.

17

- 19 THE CHAIRMAN: Is that something that you're saying that in
- 20 2001 you were not familiar with?
- A. That's correct, I wasn't familiar with it, and it would
 appear that guite a number of people weren't doing that.
- 23 If you look at studies in 2005 from Way(?), I think they
- 24 report only 6 per cent of paediatric anaesthetists are
- 25 reducing fluids in the post-operative phase.

102

- 1 MS ANYADIKE-DANES: Just while we're on that point and to
- 2 follow up what the chairman has said, the Trust, as you
- 3 probably know, engaged a surgical expert. The inquiry
- 4 have their own, but the trust's surgical expert was
- 5 Mr John Orr. Have you seen his report?
- 6 A. I have.
- 7 Q. He produced his report and if we pull up this now that
- 8 we're dealing with it, it's witness statement 320/1,
- 9 page 7. If you look at paragraph 3.3, the last four 10 lines:
- 11 "It is usual on the first post-operative day to
- 12 reduce the volume of maintenance fluid because of the
- 13 inappropriate secretion of antidiuretic hormone leading
- 14 to a potential increase in water retention."
- 15 That accords with the view that has been expressed
- 16 by the inquiry's expert, Mr Foster, and I can take you
- 17 to that as well, but I am sure you have read his report
- 18 also.
- 19 A. Yes, I have.
- 20 Q. They did not present that as a novel approach or one
- 21 that a small minority of surgeons in the vanguard, if I
- 22 can put it that way, were adopting. Their view was that
- 23 was absolutely usual.
- 24 A. So there are two points here. First of all, was it
- 25 usual? And secondly, is it useful to do so? Well,

- there are a number of studies out there that have looked
- 2 at reducing fluids in children post-operatively and have
 - failed to demonstrate that that reduces the risk of
 - hyponatraemia.

- Q. But leaving aside that point and dealing with your own
 knowledge at the time, so your knowledge therefore, or
 experience, differs from this. You would not accept
 - what Mr Orr is saying here --
- A. No, I'd never seen that done.
- 10 Q. -- or for that matter Mr Foster? You wouldn't accept
 11 their view?
- 12 A. I had never seen that done.
- 13 Q. We asked a similar thing of Mr Makar and I think almost 14 of all the surgeons that were involved at SHO level, and
- 15 I believe even Mr Zawislak, although I will check his
- 16 evidence, registrar level, and from Mr Bhalla this
- 17 morning, I think we asked him a similar question. They
- 18 were all of the view that it's fairly standard to reduce
- 19 the fluid intake for certainly a child post-operatively
- 20 in recognition of the possibility of ADH, which would
- 21 mean that water is retained and therefore, if you carry
- 22 on in the normal rate, then you're effectively giving
- 23 them too much fluid, particularly if that fluid is low
- 24 in sodium.
- 25 A. Well, I would have to disagree with their opinion

- because it certainly was not usual practice. There are 1
- 2 at least two studies out there that survey -- I think
- both of these are before the inquiry -- that survey
- paediatric surgeons and paediatric anaesthetists and
- very few of them -- I think in one study 6 per cent were
- reducing post-operative IV fluids and, in the other, 20
- per cent. In fact, on one of the studies, 38 per cent
- 8 of the surgeons and 16 per cent of the anaesthetists
- were increasing post-operative fluids. So it was far 10 from usual practice in 2001, and even as far as 2006, it 11 was far from usual practice.
- 12 Q. Yes, but if we deal with the people who had made up your
- 13 surgical team, which are the gentlemen I have just been
- 14 talking about, so as far as you are concerned, you and
- 15 your consultants in the surgical directorate hav
- 16 satisfied themselves that these gentlemen are carrying
- out matters in the way that you wish them to, with the 17
- appropriate care and expertise and so forth. And all 18
- 19 these gentlemen are talking, as I understand, about it
- 20 being guite straightforward to reduce the fluids
- 21 post-operatively. And does that mean you weren't aware
- 22 that that was their view?
- 23 A. I would not have been aware that that was their view in 24 2001.
- 25 Q. Does that mean you wouldn't have wanted them to do that

- 1 for any of your patients?
- 2 A. I don't think that that was standard practice. It
- certainly wasn't standard practice in --
- 4 Q. I understand that. That's why I've asked you this question. Does that mean that you wouldn't have wanted
- them to do that for any of your patients?
- 7 A. Not on my patients.

6

11

4

5

6

8

12

13

19

- 8 0. If they were proposing to do that, does that mean you'd have wanted them to discuss it with you?
- 10 A. If they were proposing to do that, I would have wanted them to discuss it with me.
- 12 Q. Thank you.
- 13 THE CHAIRMAN: That brings you into the area of who's
- 14 responsible for post-operative fluids, doesn't it?
- 15 A. It do
- THE CHAIRMAN: Which we'll come on to again. 16
- A. I'm sure we will. 17
- 18 MS ANYADIKE-DANES: Then if we stick with your knowledge of
- 19 hyponatraemia. Can we go to the hypotonic fluid point? 20 Just so that I make sure that I have you correctly, did
- 21 you appreciate that the administration of hypotonic
- 22 fluids could cause, in certain circumstances, dilutional
- 23 hyponatraemia?
- 24 A. That's not something that I had ever seen and I don't
- 25 recall ever being taught about it on either of the two

106

stints that I did in the Children's Hospital. 2 O. In fairness to you, that's entirely consistent with what you said in your inquiry statement. 044/2, page 34. 3 You said: 4 5 "I was aware that excessive vomiting or diarrhoea 6 could cause an electrolyte imbalance. I was not aware of the risk of infusing hypotonic solutions in children post-operatively." 8 Mr Foster, and for that matter Mr Orr, had an 10 opportunity to look at your statements and then provide 11 reports in relation to them. Mr Foster's part of his 12 report dealing with that, which is his first report, and can be seen at paragraph 8.3, but we don't need to pull 13 it up, is: 14 15 "I really don't believe he means this. It's 16 well-known that hypotonic fluids may cause dilution. In 17 my hospital, when a student firm changed over about 18 every six weeks, the first tutorial always given was one 19 on fluid balance and the serious of intravenous fluids as it was a subject not well taught at pre-clinical 20 21 school. I made sure the students were aware of the 22 dangers of dilution. The matter was also guite fully 23 covered in the basic textbooks." 24 But you are saying you weren't aware of it? 25 A. I'm saying that I had never seen a case of dilutional

- hyponatraemia nor was I aware of the very severe fall in 1
- sodium that could occur in those circumstances. 2
- 3 Q. No, I had actually put it to you in a slightly different
 - way. I had asked you about the risks of infusing
 - hypotonic fluids -- so from that point of view -- and
 - whether you understood that they brought with them
 - a risk of dilution of sodium in the body and therefore
 - hyponatraemia. That's what I was asking you.
 - A. No, I think, as we've discussed before, the only
- 10 circumstance that could happen -- apart from ADH 11 secretion -- would be is if there was a really excessive
 - amount of Solution No. 18 given. And as we have said
- before, that was a situation that I'd never considered. 14 Q. If a child was vomiting excessively, how did you think
- you addressed the sodium that they were losing in the 15 16 vomit? Sorry, as at 2001.
- 17 A. If they were vomiting excessively in 2001, as
- 18 I understand it -- and it wasn't something that I had
 - really seen very much in surgical children, if at all.
- More commonly it would have been seen in patients with 20
- 21 gastroenteritis dealt with by the paediatricians and, in
- 22 those circumstances, the main goal of therapy was to
- 23 rehydrate the patient because if you rehydrated the
- 24 patient, then that would stop the ADH response that
- 25 would arise as a result of the dehydration and their

- fluid balance would normally correct. 1
- 2 Q. What would you rehydrate them with?
- 3 A. They would normally have used No. 18 Solution. That was
- the preferred solution in the paediatric ward.
- 5 THE CHAIRMAN: For paediatricians and surgeons?
- 6 A. For paediatricians and surgeons.
- MS ANYADIKE-DANES: Would you have appreciated that 7
- 8 replacing those fluids with Solution No. 18 was to
- replace them with a fluid that would contain a lower
- 10 concentrate of sodium than was in the fluid that they
- 11 were vomiting, if I can put it that way?
- 12 A. Correct, yes, 30 millimoles as opposed to somewhere
- 13 between 50 and 75.
- 14 Q. And there was no concern, so far as you were aware, that
- 15 if there was excessive vomiting and that went on for
- a prolonged period of time and therefore over 16
- a prolonged period of time you were infusing low-sodium 17
- fluids, that you might end up with an imbalance with the 18
- 19 body having less sodium than it should otherwise have?
- 20 A. I think that would be the case if it was a prolonged 21
- period of time, but again the definition of "prolonged" 22 and the definition of "excessive" are somewhat vague.
- 23 Q. I understand that. Can I have it from you in principle? In principle, did you realise that such a situation
- 25 could lead to hyponatraemia?

109

- 1 A. If you had a very sick child, it could lead to an 2 electrolyte imbalance.
- 3 Q. Well, it could lead to a low sodium level in the body?
- A. It could lead to sodium levels that were lower than 135,
- that's correct, which would be hyponatraemia.
- 6 Q. Yes. And as we have understood it, low sodium below the parameters that are acceptable, low sodium is a way of defining hyponatraemia.
- 9 A. Low sodium -- hyponatraemia is a sodium below 135, but
 - that is in a different ballpark from a sodium of 118.
- 11 Q. Yes. But in any event, as I think you have now 12 accepted, if that situation were to arise, you would
 - have appreciated at 2001 that that could lead to
- 14 hyponatraemia?

8

10

13

- 15 A. If there was prolonged and excessive vomiting, there could be a fall in the sodium. 16
- 17 O. Yes. Thank you.
- 18 THE CHAIRMAN: Just while we're on this prolonged and
- 19 excessive vomiting, let's put it in the surgical context
- 20 of post-operative vomiting. I've heard this morning
- 21 from Mr Bhalla that if vomiting is post-operative
- 22 vomiting, one might typically expect it to start within
- a couple of hours and to last for a few hours beyond 23
- 24 that. Would you agree with that analysis? Accepting
- 25 the major caveat that everybody is different.

110

- 1 A. Everyone is different and there are figures, papers out
- there that say post-operative vomiting can go on for 24 2
- to 48 hours in children. But if I maybe just deal --3
- because I actually heard that bit of Mr Bhalla's 4
- 5 evidence and you suggested to him that because the child
- 6 hadn't vomited overnight, that that was 7 or 8 hours and
- therefore this may not be normal post-operative
- 8 vomiting.

9 THE CHAIRMAN: I'm picking that up from some earlier 10 evidence.

11 A. The point is she was sleeping overnight and one wouldn't 12 expect her to necessarily vomit overnight. But when she

- woke up in the morning and still had a full stomach and 13
- had the anaesthetic drugs, the Cyclimorph and various 14 15 other things, she also had an abdominal operation and
- 16 had some abdominal pain, no doubt, all of those things
- 17 cause a degree of gastric stasis and it's fairly clear
- 18 that she had gastric stasis because we know that at --
- 19 was it 12 o'clock in the afternoon or maybe 1 o'clock --
- 20 but whenever she vomited, she vomited rice from the
- 21 night before. So it's fairly clear that the stomach
- 22 hadn't emptied. The stomach would normally empty after
- 23 four hours; Raychel's stomach hadn't emptied for some
- 24 considerable time afterwards. So I think the early part
- 25 of Raychel's day was standard post-operative vomiting

- and we would probably have expected that to settle 1
 - within 12 hours. Not 12 hours from surgery, but 12
- hours from --
- 4 THE CHAIRMAN: So on that scenario and accepting
 - approximations, you're roughly looking from 8 am to
- 8 mm?

2

5

- 7 A. That's correct.
- 8 MS ANYADIKE-DANES: When you said "the early part of
- Raychel's day", does that mean that thereafter continued 10 romiting may be indicating something else?
- 11 A. It may be, but as I've said already, it would not be
- 12 uncommon for post-operative vomiting to continue for 24 13 or 48 hours.
- 14 Q. I'm not trying to say there are any absolutes in this --15 A. Sure, sure.
- 16 Q. -- but one is, as a physician, constantly reviewing and seeing what the new data tells you might be the problem
 - with the child and how one might treat it best.
- 19 A. Yes.

17

- 20 Q. So if there is vomiting that continues after that,
- 21 although of course in your mind you know this may still
- 22 be post-operative vomiting, you begin to think: well,
- 23 maybe I should be thinking that there is something else
- 24 happening here.
- 25 A. That's a possibility.

1 THE CHAIRMAN: Just to add to that, perhaps	the imprecision
--	-----------------

- of this is you would also be interested to know how much 2
- vomiting there is --
- 4 A. Yes.
- 5 THE CHAIRMAN: -- in the sense of how regular it is.
- 6 A. In the sense of how regular and, if possible, the volumes.
- 8 THE CHAIRMAN: Because, as I understand it, there's no
- absolute precise definition, but after two or three
- 10 vomits, the level of concern begins to increase?
- 11 A. I think I have given evidence to the coroner on that and 12 was pressed on that issue and I didn't give
- 13 a particularly good answer, for which I've apologised.
- 14 I'm not sure that anyone can set a number of vomits or
- 15 a particular volume of vomit as to when vomit becomes
- 16 pathological. That is something that we as surgeons
- rely on the experience of the nursing staff to inform us 17
- of. 18
- 19 THE CHAIRMAN: Okay. I can understand why you're saying,
- 20 "I'm not concerned about two vomits, but I am concerned
- 21 about three" I can understand that line would be very
- 22 harsh to draw. But when you get up to six, seven and
- 23 eight, then your concerns must be increasing quite
- 24 substantially?
- 25 A. I would think one would be concerned about that.
 - 113

- 1 THE CHAIRMAN: Yes. And if that also includes the fact that
- an anti-emetic given at about 6 o'clock has not brought 2
 - an end to the vomiting, then the concern increases even more substantially?
- A. Well, anti-emetics don't always work.
- 6 THE CHAIRMAN: No, they don't, but by the time Raychel was given any anti-emetic, she had vomited a considerable
 - number of times and she continued to vomit after the
 - anti-emetic. So it's not just that the anti-emetic
 - isn't working, you now have increasing prolonged
- 11 vomiting

9

10

12

13

16

17

19

20

25

- Ms Anyadike-Danes, it's 1.15. If it's not entirely inappropriate after discussing vomit, shall we break
- 14 until 2 o'clock? 15
 - Mr Gilliland, a lot of your evidence straddles an
 - undefinable line between clinical evidence and
 - governance evidence. So what we intend to do today is
- to take as far as we can with the evidence because 18
 - I think it's pretty much inevitable that we will be
- asking you to give evidence in the governance section 21
 - again. We'll get as far as we can today and pick up any
- 22 issues which aren't covered in governance. Okay? So
- 23 we'll start again at 2 o'clock.
- 24 (1.15 pm)

(The Short Adjournment)

114

1 (2.00 pm) patients, but to act in a -- really as an assistant. 1 2 (Delay in proceedings) 2 (2.11 pm) 3 4 MS ANYADIKE-DANES: It was brought to my attention that 5 I hadn't actually given the reference when I was putting 5 6 to you various comments that the JHOs had made in 6 7 relation to their role and asking you to comment on that 8 and drawing to your attention a possible difference 8 between how they saw it and how you regarded it --10 I hadn't given a reference. Can we please pull this up? 10 11 It's a transcript from 6 March, page 17. It's the 11 12 evidence of Dr Devlin. If you look at lines 11 to 25, 12 arranging investigations, progressing a management plan. really, it's where I think he captures it. He says: 13 "At that time, junior house officers would do all 14 14 he's a JHO? the what I would call 'ward work', which would be all 15 16 the routine tasks on the ward. So that might include 17 change of catheters, change of Venflons, blood tests, 17 Mr Orr, who's commenting on it, it's witness statement 18 writing up kardexes. We spent a lot of time following 18 320/1, page 11. He comments on that way of working, 19 out the instructions of a consultant for that day and 19 20 they may have requested us to get a CT scan organised or 20 21 some radiological investigation, and we would have had 21 22 to go down to the radiology department and try to 22 23 organise that sort of thing. We went on ward rounds as 23 appropriate. 24 well as with the consultants. But primarily, our job 24 25 was not to direct medical or surgical management of 25 He said:

116

- We were really acting as medical assistants and we were learning by observation. Our task, I don't feel, as JHOs was to what I would call direct medical or surgical
- care of patients, but we did all the ward work and

we were very, very busy."

Would you accept that as a correct characterisation of what JHOs were doing?

- A. Yes, I think that's correct. I think what Dr Devlin is
- meaning, if I can interpret what he is saying, is
- directing medical or surgical care would really b
- 13 THE CHAIRMAN: And that's what he would not be doing because
- 15 A. That's correct, that would at a higher level.
- 16 MS ANYADIKE-DANES: If we can just look at the report of
- which is really that the JHOs are the first in line and,
- leaving aside the ward round, which perhaps directs the
- care for that day, but in terms of contact, it's the
- JHOs who are first in line and it's for them to contact
- their more senior colleagues if they consider it

1	"The appropriateness in 2001
2	THE CHAIRMAN: Where are you?
3	MS ANYADIKE-DANES: At (1):
4	"The appropriateness in 2001 of giving the
5	responsibility to junior house officers to attend with
6	a post-surgical patient who was unwell and who was
7	vomiting more than 12 hours after surgery."
8	That is a question that the trust had put to the
9	witness and you see by $\ensuremath{"}\ensuremath{A}\ensuremath{"}$, that is his response to that
10	question. So how appropriate was it to do that:
11	"It was appropriate for the JHOs to attend Raychel,
12	but JHOs from a general surgical team would require
13	close supervision when attending post-operative surgical
14	patients and would require supervision and direction for
15	emergency care."
16	So if one leaves out the emergency care element of
17	it, Mr Orr's position or view is that if those JHOs are
18	attending post-operative surgical patients in this
19	case Raychel, which they did do then they would
20	require close supervision; would you accept that?
21	A. I think what Mr Orr is trying to say here is that it was
22	appropriate for the JHOs to attend. What he means by
23	"close supervision" is unclear to me. He cannot
24	possibly mean that an SHO would be beside a JHO every

25 time they go to a surgical patient because that would

117

not be possible.

1

6

14

15

1

6

17

23

24

- 2 THE CHAIRMAN: It's also a bit curious that he talks about
 - "close supervision when attending post-operative
 - surgical patients", but then drops the word "close" from the emergency care. It looks like the wrong way round,
 - doesn't it?
- 7 A. Maybe a little the wrong way round.
- 8 MS ANYADIKE-DANES: Except for what's added to the emergency surgical care, which is "supervision and direction", but
- 10 in any event he will be able to address those points
- 11 himself when he gives evidence. What I was asking you
- 12 to comment on is the view that when JHOs were responding
- 13 to post-surgical, particularly paediatric patients, the
 - level of supervision that you think is necessary for
- 16 A. But that was the JHO's job. They would be the first
- 17 responders to all post-surgical patients and therefore
- the level of supervision was that they had an SHO who 18
- 19 was on call above them and who they could contact at any 20 stage if required.
- 21 O. Yes. I think that's the issue. It's that particular
- 22 system that I'm going to ask you about later on when we 23 deal with the aftermath and when the clinicians and
- 24 nurses started to reflect on what happened in the course
- 25 of Raychel's case. That is one of the points I'm going

- 1 to ask you about, whether that particular system was
- a system that had its flaws, if I can put it that way, 2
- and how that can be addressed. And that's why I've 3
- started this way for you to start off with a description 4
- 5 of what the system was. Then you can help us when we
- 6 get to the aftermath as to what people thought might be
- the potential flaws in that system and how that could be
- 8 addressed, if I can put it that way to you.
- 9 A. Okay.
- 10 Q. So as far as you were concerned, if you were simply
- 11 describing the system as it operated in Altnagelvin at
- 12 that time, was that system that the JHOs were first in
- line and they did do certain things. If they felt they 13
- were out of their comfort zone, then they were to ask 14
- 15 for help from more senior colleagues --
- 16 A. That's precisely --
- 17 Q. -- but they were first in line?
- 18 A. That's precisely correct.
- 19 $\,$ Q. To a certain extent then, that system therefore depended
- upon them recognising when they were about to get into 20 21
- an area that perhaps they ought to seek guidance from
- 22 their more senior colleagues.
- 23 A. It did.
- 24 Q. Thank you. Then you've helped us with what you thought
- the various grades should be doing and what their 25

- responsibilities were. If we come now to the question
- of a named consultant. What did that actually mean in 2
- Altnagelvin in June 2001, that a patient had a named consultant?
- 5 A. It meant the same in Altnagelvin as it meant anywhere. Every patient had to be admitted to the hospital under
 - the name of a particular consultant, medical or surgical
- 8 or whatever specialty, and that person overall was
- responsible for ensuring that there was a system that 10 ould deliver care to that patient.
- 11 Q. You said "was responsible for the system", so there 12 might be two things, mightn't there, happening? One is that there is a system whereby things are reported to 13
- the consultant appropriately. The other is, in any 14
- 15 given case, that consultant is able to discharge those 16 obligations, if you see the difference. One might mean
 - that you have an appropriate hierarchy or a way in which
- 18 you get told about things and those formal constructs
- 19 might be ward rounds, note keeping, teaching the juniors
- 20 how they should get in touch with their more senior
- 21 colleagues. That sort of thing is a system that's in 22 place.

 - The other might be how that system is actually
 - operating in relation to this particular child, which is
- 25 Raychel, so that you would be able to discharge your

1 obligations to her.

- 2 A. Yes.
- 3 Q. So you've, I think, described the system of how you
- would expect a consultant to be told about issues.
- If we just finalise that part of it though by helping us
- with, this: how does a consultant first recognise that he has a child in his care?
- 8 A. Well, the consultant would not know on the night of
- admission that he had a child under his care unless
- 10 he was phoned about that child.
- 11 O. Yes.
- 12 A. So the first time that he would know about that would 13 probably be during the morning activity the following 14
- day.
- 15 Q. And how does that come about? Is that because there's a ward round or there's some other thing that prompts 16
- his knowledge that this child is now in his care? 17
- 18 A. There's a ward round in the morning, which would be 19 conducted by the consultant or registrar or certain
- 20 parts of it may be delegated to others members of the
- 21 team and it would be important that those members of the
- 22 team fed back to the consultant so that he was aware
- that he had or she had a child, or any patient, under 23
- 24 his or her care.
- 25 Q. When Mr Makar was describing that, he was saying that

121

- a list would be drawn up and different people have given
- us different evidence as to who's responsible for 2
 - drawing it up. But in any event, a list is drawn up
 - and, as we understand it, on that list is indicated
 - those who are new patients who have just come in, those
- who have had their surgery the previous evening, and
- those who may not be new patients, but for whom concerns
- have arisen. So those are all indicated on a list for
- the surgeon to be able to see and appreciate. Does that
- 10 accord with your recollection of how things worked?
- 11 A. That's a common system, but I cannot recall if that 12
- system with a list was definitely in place in 2001. 13 I just don't have a clear recollection of that.
- 14 Q. Maybe help us with it in this way: assuming that the
- 15 child is not a child who presents any great difficulty
 - when she comes in in the evening. So she's come in out
 - of hours, if I can put it that way, and there has been
 - a decision made to conduct surgery on the child, and
- 19 whoever is making that decision doesn't feel that that's
 - something that needs to be told to you at that stage.
- 21 Then come the morning, ordinarily there will be a ward
- 22 round
- 23 A. Yes.

1

8

16

17

18

20

- 24 Q. A post-take round.
- 25 A. Yes.

122

- 1 Q. How do you personally get to know that that child is
- your patient and has had surgery? 2
- 3 A. Well, the standard practice will be that we would have
- started our ward round, usually in the adult wards, in 4
- 5 Ward 9, and would have progressed through the adult
- 6 wards, Ward 9, Ward 8. We may then have gone to Ward 7
- so check if they were any outliers in the urology ward.
- 8 We may have gone to Ward 6 to check out if there were
- any outliers there, or if that were not possible at the
- 10 time, the usual question to the team would be: are there
- 11 any outliers, is there anybody else who needs to b
- 12 seen, are there any concerns about anyone who is not 13 within our ward?
- 14 Q. In that team, that surgical team who is carrying that 15 out, are they the new team for that day or do you have
- 16 anyone from the previous shift who are effectively also 17 providing the role of handover?
- 18 A. No. The team who would do the ward round would be my
- 19 team -- not just for that day, they would be my team.
- It was not standard practice in Altnagelvin to have 20
- 21 someone from the team the night before join the ward
- 22 round because those people had their own duties that
- morning. They would have been assigned to their own 23
- 24 team doing their own team's ward round and then
- 25 progressing on to whatever their team had to do that

dav.

1

10

11

- 2 Q. So if we put that in Raychel's context, does that mean
- your team for that day, that's the Friday June 8, would
- have been Mr Zafar, doctors Curran and Devlin, and
- Mr Bhalla as a registrar?
- Q. That's why I put it to you so that you can help us.
- 8 A. I presume Mr Zafar was on our team, that's why he went
- to see Raychel. Mr Bhalla was the registrar on call for that 24 hours, and I believe he was working with another
- team at that point. Dr Curran, as far as I know, w
- 12 doing a locum in surgery that night because the surgical JHO was sick --13
- 14 Q. Sorry, I meant during the day, first of all. Let's deal 15
- with the day. I think what Dr Curran said is that 16 he was medical JHO during the day and then after that he
- 17 came on call to do surgical work.
- 18 A. That's correct. He was a medical JHO; he wasn't part of 19 the surgical team whatsoever.
- 20 Q. So during the day team would be Mr Zafar, we've got so
- far. Who else would be part of the team? 21
- 22 A. I can't remember who the registrar was at that stage.
 - I suspect it was Mr Thomas, but I don't know for sure.
- 24 Q. And there would be JHOs?
- 25 A. There would have been a JHO normally.

- 5
- 6 A. No.

- 1 0. Could that be Mr Devlin?
- 2 A. No, because he was in urology and I think that's in his
- 4 Q. So there'd be some other JHO, one or two?
- 5 A. Usually one. We also know that there was one off sick
- that day. I don't know who that was or whether that was the JHO specifically related to our team.
- 8 O. Barring emergencies and other matters that would detain
- you, would that day normally start with you taking the 10 ward round?
- 11 A. I would normally do a ward round most days, but not 12 every day.
- 13 Q. Yes. And I think the way you have described it, there
- 14 would be you, there'd be your registrar and you'd have 15 an SHO and possibly a JHO.
- 16 A. That's the usual team.
- Q. And you would start with the top and work your way down. 17
- Then you mentioned about the outliers. How did that 18 19 work?
- 20 A. Well, if we had time we would go and see all of the
- 21 patients or, alternatively, if a patient had already
- 22 been seen that morning and we were assured that that
- 23 patient was satisfactory, we wouldn't necessarily go to
- 24 see them. Or if I had other duties to do it is possible
- I would delegate some of the ward rounds, even some of

- the adults patients on wards 7 and 8, to those other
- 2 members of the team to see.

1

8

- 3 Q. Yes. In terms of knowing that this is a new patient or this is a patient who's just had surgery or this is
- a patient for whom there are some concerns and we maybe
- 6 need to think about their treatment, whose
 - responsibility is it to draw that to your attention as
 - your are conducting the ward round?
- 9 A. The person who had seen that patient.
- 10 Q. Who had seen the patient?
- 11 A. Yes. Oh sorry ...
- 12 Q. That's why I'm confused. Sorry, because on that Friday 13 morning, unless Mr Makar had turned up, nobody would
- 14 have seen that patient from your team for that day.
- 15 A. No, Mr Zafar had seen that patient that day.
- 16 Q. My understanding is he said he saw Raychel as part of 17 a ward round.
- 18 A. He saw Raychel because he went to see Raychel, which he 19 would term as the ward round.
- 20 O. Yes, exactly. That's why I was asking you. If you were 21 doing it in the way you have just characterised it.
- 22 which is you, your SHO, registrars and so forth, when
- 23 you start your series of ward rounds, who is alerting
- 24 you to those patients who are new, who have just had
- 25 surgery or who have problems? Whose responsibility

126

- is that?
- 2 A. There wasn't at that stage a specific system that I can
- recall. When you went round the adult wards, we would 3
- be seeing all of the patients who were under my care 4
- 5 and, on a Friday morning, possibly under Mr Neilly's
- 6 care as well because that would be his normal theatre
- day. So as we walked round the adult wards, we would
- 8 also be brought to any new patient who had been admitted the night before.
- 10 Q. I see. So you would be seeing them all actually and it 11 would maybe be the nurse or the junior doctor who is
- 12 holding the notes who would draw your attention to the
- fact that this is a particular issue in relation to this 13 patient? 14
- 15 A. Well, the nurse would know that was a new patient who
- 16 had been admitted overnight. They would have had that 17 handover on their morning handover.
- 18 Q. Does that mean typically you would see each and every 19 one of your patients that morning?
- 20 A. Typically, but not exclusively. It wasn't standard
- 21 practice to everybody every day.
- 22 O. A patient like Raychel, a 9-year-old child, come in the
- 23 previous evening, had the surgery, no concerns, if I can
- 24 put it that way, about the surgery; barring more
- 25 pressing concerns for you, is that a child that you

- would see as part of your normal ward round?
- 2 A. She could certainly be part of the normal ward round, but again if she had been seen already and she was seen
 - at 8.30 in the morning and I'd been reassured that she
 - was okay, there would be no specific need to see her.
- 6 Q. If she was going to be seen like that by another member of your team, in the way that Mr Zafar saw her, who is the person in the system who would direct that that
- should happen?

5

8

15

16

- 10 A. In the system, well, that would either be myself or the 11 registrar. But as I've said, I think in my written
- 12 statement, all members of the surgical team would
- understand that it is their responsibility to see all 13
- patients who are under the care of that team. So it 14
 - could well be that Mr Zafar had taken it upon himself to
 - go and visit Raychel that morning. He did it early
- 17 in the morning before perhaps the business of the normal
 - ward round would take place.
- 19 Q. That wasn't actually his evidence. His evidence was not 20 that it was his initiative.
- 21 A. No, his evidence was that he was sent by the registrar.
- 22 Q. Yes. So that means therefore, if you're not there, that
- 23 the registrar presumably is looking at the list of your
- 24 patients and deciding, in the time available and given
- 25 what would appear to be the needs of those patients,

1		these are the people I'm going to deploy to conduct
2		a ward round in relation to them.
3	A.	Yes.
4	Q.	Is that how it would work?
5	A.	That's certainly a system that would work.
6	Q.	Yes. And how often did that happen that you didn't just
7		work through your patients and you despatched a member
8		of your team to conduct a ward round in relation to
9		a particular patient?
10	A.	That wouldn't be uncommon. I can't say how often it
11		happened, but it certainly wouldn't be common practice
12		then or now for the consultant to see every patient if
13		there are members of his team who are competent to
14		assess another patient.
15	Q.	The inquiry's experts have raised an issue as to
16		$\ensuremath{\operatorname{Mr}}$ Zafar, who has fairly acknowledged that he had very
17		limited paediatric experience
18	A.	Yes.
19	Q.	as to him going to carry out a post-take ward round
20		on a paediatric patient, maybe that that was not
21		appropriate. Can you offer a comment on that?
22	A.	Well, we obviously looked at that afterwards, but as far
23		as I can tell, no one has suggested that anything that
24		Mu Refer did at that time one mentionland.

- 24 Mr Zafar did at that time was particularly
- 25 inappropriate. He saw Raychel, he assessed her and he

- gave reasonable instructions to the nursing staff.
- 2 Q. Yes. I didn't mean it from that point of view. I'm not
- suggesting that at all. All I'm saying is that at the
- time he's despatched, nobody knows that. You're
- speaking from hindsight. So the advice that we had
- received is that that might not be appropriate in
- a first post-take ward round to send somebody with only
- limited experience of paediatric patients to do that by
- themselves -- I don't think anybody would have had any
- difficulty if he'd been accompanied, but to do that by
- 12 A. Well, Mr Zafar had had a considerable amount of
- 13 experience in general surgery. He had done 18 months in 14 Russia where he qualified, he did 30 months in
- 15 Wythenshawe, he was FRCS qualified, he was a recently
- 16 experienced surgeon. I would have expected him to be
- 17 able to assess a post-appendicectomy child reasonably
- 18 well and to have brought to our attention any particular
- 19 concerns that he had.
- 20 Q. So in your view, although that's what some of the expert 21 advice might be, you don't see that as an issue?
- 22 A. I don't see that as a particular issue.
- 23 Q. Thank you?

1

5

6

8

9

10

11

- 24 THE CHAIRMAN: At the time Mr Zafar went to see Raychel, is
- 25 it likely he'd have had some information about her

130

1 condition before he reached her? In other words that there had been some form of handover or --2 3 A. Yes, if he had been sent by the registrar, one presumes that the registrar had said to him: there's a child 4 5 who's had her appendix out overnight, go and see her. 6 THE CHAIRMAN: And the source of the registrar's 7 information? 8 A. I presume would be from a direct verbal handover from 9 the SHO or from the list that Ms Anyadike-Danes is 10 referring to. 11 THE CHAIRMAN: Thank you. 12 MS ANYADIKE-DANES: Just so that I give you precisely where that comment comes from, from the experts, so you can 13 see it, it's Mr Foster's report, 223-002-010. If you 14 see under "comment", Mr Gilliland: 15 16 "Clearly there was no senior ward round on the 17 morning of 8 June by anyone above SHO level. Dr Zafar 18 does not tell us what his continued observations should 19 be, although there is no doubt that, on the morning 20 of 8 June, Raychel would have been well and there would 21 have been little cause for concern. It should be 22 remembered, however, that Dr Zafar was commencing 23 a 24-hour on-call period for all surgical admissions and 24 would have had little time to look at the details of her 25 case. There is no evidence, for instance, that he noted

1	or had brought to his attention the abnormal urine
2	tests."
3	Then he goes on to say:
4	"There is no question that after a 24-hour duty
5	period a round of patients admitted should be made by at
6	least a registrar reporting to the consultant or,
7	ideally, by the consultant himself; this has been my
8	practice throughout a 28-year career as a consultant and
9	such a post-take round is essential in the training of
10	junior surgeons and medical students and an important
11	part of the day."
12	He goes on then to talk about the continuity of
13	care.
14	THE CHAIRMAN: So he's saying that in Raychel's case, as
15	a minimum, it should be the registrar if the consultant
16	cannot do it.
17	A. That is what he's saying, but he's also under the
18	misapprehension that Dr Zafar was not FRCS and didn't
19	have significant general surgical experience.
20	I wouldn't disagree with his comments about how after
21	24-hour duty a round of patients should be done by at
22	least an SPR or a consultant and that was my practice
23	for many years. But it doesn't mean that every single
24	patient would necessarily have to be seen, particularly
25	if they had been seen and if there was no cause for

1		concern raised.
2	MS	ANYADIKE-DANES: In fairness, I think Mr Zawislak and
3		Mr Makar said in their evidence that you typically did
4		see your patients and indeed wanted to see your
5		patients, so a point was made on that. Just
6		if we complete this bit about Mr Zafar's training or at
7		least experience, if we go to 223-003-011, at 6.5:
8		"On 8 June, Dr Zafar, with 4 months' experience as
9		an SHO, was solely responsible for this important round.
10		No consultant or SPR was present. This is entirely
11		unsatisfactory and unsafe and evidence of
12		disorganisation of the surgical services at the
13		Altnagelvin Trust."
14	A.	A comment in Mr Foster's report
15	Q.	Yes.
16	A.	Well, I've obviously read that and I don't necessarily
17		agree with it. As I've said already, Dr Zafar had
18		considerable experience as an SHO, not just four months.
19		He had four months' experience with paediatrics at this
20		stage, but he had considerable experience as a surgeon
21		before that and he was already had his Fellowship of
22		Surgeons.

- 23 Q. In fairness, it's the paediatric experience that
- 24 Mr Foster is really driving at; it's not that he doesn't
- 25 recognise that he had other surgical experience.

1 A. Sure.

6

10

24

3

10

11

14

20

- 2 Q. And Mr Zafar, in fairness to him, has accepted that he
- had very limited paediatric experience. So the point
- that Mr Foster is making is: to then send him to do
- a post-take ward round for a paediatric patient by
- himself -- that's the concern that Mr Foster is raising.
- 7 A. I think it's also fairly clear from Mr Zafar's evidence 8 that if he had had any concerns about Raychel, he would
- have contacted us, or if he had concerns about her fluid management, then he would have contacted the paediatric
- 11 service
- 12 Q. Yes. So you are helping us with how you would learn 13 that a patient had come into your care, if I can put it 14 that way. If you're not able, for whatever reason, to
- 15 carry out the ward round, then how do you know that
- 16 a patient has come into your care?
- 17 A. You normally ask the registrar, have you seen everyone,
- 18 is everyone okay, what patients were admitted overnight, 19 and you would get a report back.
- 20 0. And did you do that?
- 21 A. I have no recollection of my actions that morning.
- 22 Q. It doesn't mean it didn't happen, but we can't see any
- record in any of the documentation we've been provided 23
- 25 so as to alert you or for you to discover that Raychel

134

that anybody contacted you or that you contacted anybody

- had become your patient.
- 2 A. No, I don't think there will be any documentation about
- that because that would be normal verbal communication. 3
- 4 0. Nor have we been able to receive any evidence to the
- 5 fact that that actually happened.
- 6 A. I've been perfectly honest about that. I cannot recall
- the exact events of that morning. I've explained to you
- 8 what my normal practice was -- I think other people have
- 9 explained it too -- but I do not recall the exact events 10 of that morning.
- 11 Q. Does that mean a situation as may have happened with 12 Raychel where you, for some reason, don't actually
- 13 appreciate that she has become your patient is actually
- 14 quite a rare occurrence?
- 15 A. That would be a very rare occurrence, yes.
- 16 Q. Is that something that you would want to find out, how 17 that happened?
- 18 A. That is precisely why I don't think that was the case
- 19 because I think if the case had been that I was unaware
- 20 that there had been a child under my care and this
- 21 tragic thing had happened to her, that I would have
- 22 wanted to find out why I didn't know about it. I have
- 23 no recollection of conducting any enquiry with regards
- 24 to that. So I have to assume that I was aware that this
- 25 child was under my care.

- 1 Q. If you are aware that a child is under your care, but
- you can't carry out the ward round, how do you exercise 2
- your responsibility over the child's care, which you've
- 4 said in your witness statement that it was your
- 5 responsibility to oversee Raychel's care? How does that work during the course of the day?
- 7 A. That works in the same way it works for any patient that 8 I haven't seen on a daily basis. There is a team who
- are responsible for seeing those patients and that team,
- effectively, report to me during normal working hours
- or, if I'm on call, beyond that period of time.
- 12 Q. If for some reason you can't attend the ward round --13 and it seems pretty clear that you didn't attend the

ward round, at least not the ward round in relation to

- 15 Raychel. Let's put it that way.
- 16 A. Yes.

that sort?

- 17 Q. If that cannot happen for good reasons, then do you not 18 try and see that patient at some point during the day or 19 make contact with the patient's parents or something of
- 21 A. No, not always. That would not be standard practice
- 22 there. Lots and lots of patients are admitted under the
- NHS under the name of a particular consultant who would 23
- 24 not necessarily see that consultant during their
- inpatient admission. That would be common practice. 25

- 1 Q. Would you expect Raychel's parents to know that you were 2 Ravchel's consultant?
- 3 A. I don't know whether I would have expected them to know
- that or not.
- 5 Q. Is that not part of the GMC good practice guide that
- you've been talking about, that the patient should know who the consultant is?
- 8 A. Possibly. I can't remember the exact reference, I'm not
- sure. That certainly has been practice and normally the
- 10 name of the consultant responsible would be above the
- 11 bed. That's certainly the practice in our own current
- 12 hospital. Again, I can't recall in 2001 whether that
- 13 was practice in the paediatric ward at that time.
- 14 Q. Let me put it to you slightly differently. Would it not
- 15 have been appropriate for you to, at some point during 16 that day, have seen Raychel?
- A. I don't think that that was necessary in a child who had
- 17 had a routine appendicectomy performed the night before 18
- 19 and in whom there appeared to be no problems that
- 20 morning and where a normal post-operative course was
- 21 anticipated
- 22 THE CHAIRMAN: As the day went on, as concerns emerged --
- 23 and we'll come to this in detail later -- would you have
- 24 expected to have been notified that there were problems
- 25 developing?

- 1 A. If people knew that problems were developing and they
- required my input, yes, I would expect to be told. 2
- 3 MS ANYADIKE-DANES: Even leaving aside requiring your input,
- in terms of her being your patient, would you not want
- to know that she appears to be deteriorating? Mr Zafar,
- who carried out the ward round thought that everything
- was fine, she'd had -- you can never call an
- appendicectomy routine. I suppose that's

6

8

10

11

12

13

- inappropriate -- but in any event, she'd had one that
- had been uneventful. I suppose you could say that. It
- had not disclosed any real problems with the appendix
- itself. When he saw her, she was well, she was up, she
- was pain free, her father thought that she looked fine. 14 A. Yes.
- 15 Q. And what he had projected for her was that she would gradually be taking fluids on, she would have a light 16
- meal at some point that day, with a view to being 17
- discharged the next day. That's what he projected 18
- 19 forward, if I can put it that way, for Raychel. So if
- 20 that's what was thought to happen to one of your
- 21 patients and then that wasn't happening and she was
- 22 deteriorating, leaving aside whether your input is
- 23 necessary for your guidance, if I can put it that way,
- 24 would you not want to know that that is what is
- 25 happening with one of your patients?

138

- 1 A. I think you would want to know if there was a serious
- deterioration in your patient and that that was 2
- something that the registrar or SHO could not handle and 3
- they wished you to be involved with it. 4
- 5 Q. But leaving aside the involvement point, it's your
- 6 patient.
- 7 A. It is.
- 8 Q. You're ultimately in charge of her care. Now that
- element of it you may be saying, "I'm handling that by
- 10 knowing that an experienced person in whom I repose
- 11 confidence is dealing with her, and if they need my
- 12 input, they'll seek it". So that part of it is -- but
- for the mere fact that she is your patient, would you 13
- not want to know that she is deteriorating? 14
- 15 A. I think if she was deteriorating significantly, I would 16 definitely want to know, but again I'm trying to frame
- 17 this in what is normal practice. And normal practice
- 18 would be that if a patient is deteriorating and an SHO
- 19 or registrar sees that patient and they are able to
- 20 correct that deterioration and bring that patient back
- 21 on to course, they don't necessarily need to let the
- 22 consultant know about that, and we wouldn't expect them 23 to.
- 24 Q. Yes, well, then if I understand you to say, if they
- 25 aren't able to do that, they're in the throes of taking

- steps, but she still continues to deteriorate, it's 1
 - a continuum, if I can put it that way?
- 3 A. It is.

2

- 4 0. Then at some point do you not want to know, even if it's
 - simply communication to say, "This is what's happening,
 - we are dealing with it, but thought you ought to know
 - that things haven't gone quite as we thought they would
 - in the morning". Something as straightforward as that.
 - Would you not want to know at least that?
- 10 A. That seems reasonable, yes.
- 11 Thank you. And you would have considered that entirely 12 appropriate if you'd had a communication like that, even 13 if they weren't asking you to come down to the ward and see her, just to let you know? 14
- 15 A. Absolutely.
- 16 Q. Thank you. As I've indicated, and as of course you
- 17 know, there was a deterioration in Ravchel's condition. 18 There are steps along the way to which there was
- 19 intervention, if I can put it that way. But before
- I get to those actual events, can you help me with 20
- 21 this: were you surprised to know that by the time of
- 22 Raychel's seizure and collapse, if I can call it that,
- at 3 o'clock on the Saturday morning, that apart from 23
- the ward round in the morning, she had only been seen --24
- and excluding Dr Butler from that -- by JHOs? Would 25

1 that surprise you?

- 2 A. It certainly was a cause for concern. I think the
- problem was that no one at that stage realised what was
- exactly happening to Raychel and how rapidly she was
- deteriorating.
- 6 Q. Yes. That actually goes back to something that we were discussing before about the JHOs being in the front
- 8 line, if I can put it that way.
- 9 A. Oh yes, it does.
- 10 Q. We're going to come to that because I assume one of the
- 11 things that you looked at ... In fact, I know from --
- 12 well, I don't know, but I've heard from Sister Millar
- 13 and Staff Nurse Noble that that very thing was something
- 14 that was considered during the critical review meeting
- 15 about that. You, I think, therefore would agree that
- 16 that was unsatisfactory and you'd have wanted more
- senior involvement before then? 17
- 18 A. Yes.
- 19 Q. Thank you. So then if we go now to the stages, and
- 20 maybe you can help us with when you would have wanted --
- 21 irrespective of whether it was asked for -- more senior
- 22 involvement, if I can put it that way. So I think you
- 23 very clearly said that the decision to operate, you were
- 24 content that that was a matter that Mr Makar could
- 25 address. He notified his registrar, Mr Zawislak, and so

141

- far as you're concerned you wouldn't have wanted any
- more senior involvement than that; would that be fair?
- 3 A. That's fair.

1

2

6

8

10

11

13

17

- 4 Q. And then if we go to the next morning, I've asked you
 - about Mr Zafar's conduct of the post-take ward round and
 - I think your evidence, in summary, has been, given his
- experience as a general surgeon and given the fact that
- there didn't appear to be any concerns about Raychel at
- that point this time, everything had been fairly
- straightforward, that you would be content at that level of senior involvement in her care; is that fair?
- 12 A. When we reviewed her case, I was content with what had happened that morning.
- 14 Q. Yes. So she has had her first vomit by then, but 15
 - you have explained that that can happen as the child
- 16 sits up and starts to move about and that can prompt
 - that sort of reaction. But then during the day, she
- starts to vomit. By 6 o'clock -- well, let me start 18
- 19 a bit earlier than that in fairness. At about noon,
- 20 there's a change in her IV fluid bag. And there isn't
- 21 a member of the surgical team available to do that for
- 22 the nurses, so Dr Butler comes, writes up the
- 23 prescription, and a new bag is erected. Mr Zafar's
- 24 evidence was he had rather -- his evidence was not
- 25 entirely clear on this point. But one interpretation of

142

- it is that he had rather thought that she would be
- sufficiently well that either she wouldn't need any more 2
- fluid or, if she did, not much more fluid, and he would 3
- be wanting to know that somebody was erecting another 4
- 5 bag so that he could find out what they thought at that
- 6 time were her continuing fluid needs, if I can put it
- that way.
- 8 So he would have wanted to have been involved, even

just at the level of being informed. Do you have a view 10

11 A. I think it's not uncommon for children to need IV fluids 12 beyond -- I think that was around 12 o'clock.

13 Q. It was.

A. I think that wouldn't be uncommon. She had woken up 14 that morning, she had vomited first thing, there were 15

- 16 two or three other developments. We know from her
- 17 mother's description that in and around 12 o'clock she
- 18 had a vomit of rice from the night before, which was
- 19 just sitting in her stomach. Clearly she was going to
- need IV fluids for a little bit beyond 12 o'clock at 20
- 21 that point, I don't think it would be unnatural to have
- 22 written up another bag of fluids at that stage, and I'm 23 not sure that there was a specific need to call us at
- 24 that stage.
- 25 Q. Just while we're at that point, one of the reasons why

- Mr Zafar said he didn't really concern himself overly
- with the rate of her fluids, although he went through 2
 - the calculation and I believe he recognised that 65
 - would have been more than her maintenance level, but he
 - wasn't overly concerned about that because in his view
 - she wasn't going to be on those fluids for very long, so
 - -- you can't say it's academic, but it wasn't something
 - - From your point of view, would you have thought that
 - 80 ml an hour was above her maintenance level?
- 11 A. 80 ml an hour is above her maintenance level.
- 12 Q. So if she was going to have another prescription, another bag at that rate, would you have wanted anyone 13 to pause and think, "Does it need to be 80 ml?" 14
- 15 A. I think for anyone to pause and think before they write a prescription would be reasonable.
- 17 Q. Yes. But having paused and thought, would you have 18 wanted them to consider whether 80 ml was the 19 appropriate rate?
- 20 A. Yes, I would have, and they would therefore need to
- 21 probably look back through the fluid balance, calculate 22
- what her deficit was. She had been fasting since 23
 - 5 o'clock the night before and whenever she went back on
- IV fluids in the ward -- I think that was 2 o'clock 24
- 25 in the morning --

10

16

1

8 that concerned him.

1	0	Ves
-	¥.	100.

- 2 A. -- so that is nine hours, is it? Seven?
- 3 Q. In fairness, she'd had pre-op IV fluids.
- 4 A. 60 ml.
- 5 Q. Yes. Then she'd gone into theatre and she had been on
- 6 Hartmann's while she was in theatre. When she then came
- 7 out of theatre and went to the ward, they reinstated
- 8 that previous prescription, so she went back on the
- 9 Solution No. 18 at 80 ml an hour.
- 10 A. That's correct.
- 11 Q. So she had been on it more or less continuously. She 12 had been on some IV fluids more or less continuously.
- 13 A. She had been on some IV fluids, but she was still
- 14 probably in deficit. I think her deficit calculates out
- 15 at about -- she would have needed 585 ml between
- 16 5 o'clock and 2 o'clock in the morning. She had had
- 17 about 260, so she still had a certain amount of deficit.
- 18 Q. Well, depending on whether there was any response on the 19 ADH issue. But I think when you were -- she was
- 20 retaining fluids as a response to her surgery.
- 21 post-operatively
- 22 A. Well, we wouldn't have known that at that stage. We
- 23 simply would have looked at her fluid balance and
- 24 realised she had been fasting for six hours before she
- 25 went to theatre. There's a certain amount of fluid that

- she hasn't had during that time and there's still
- 2 a deficit to make up.
- 3 Q. I appreciate that. I think before we started along
- that, what you had indicated is that somebody would have had to assess what her fluid needs were --
- 6 A. Yes.

1

8

- 7 Q. -- and in doing that, whether 80 ml an hour was an
- appropriate rate for her.
- 9 A. It would be appropriate for someone to assess that.
- 10 Q. Yes. So in other words, it's just not a matter of even
- 11 though that's what the nurses really want at the moment
- 12 because the bag is emptying, they really want somebody
- 13 to do something, yes -- from your point of view, anybody
- 14 who's going to intervene like that, you would have
- 15 really wanted them to have taken stock of the situation
- 16 and assessed whether a bag at that previous rate was 17 appropriate.
- 18 A. That would be normal practice.
- 19 O. And you would want that, whether that was one of
- 20 a member of your surgical team doing that or whether it
- 21 was a paediatrician assisting to intervene on one of
- 22 your surgical patients?
- 23 A. They're making a prescription, so it applies whether
- 24 it's surgical or medical.
- 25 Q. Thank you. So as long as that's happening, do

146

- 1 I understand you to say that you don't think that any
- 2 more senior intervention would have been necessary at
- 3 that point so long as somebody's assessing her needs and
- 4 forming a view?
- 5 A. This is at 12 o'clock?
- 6 Q. Yes.
- 7 A. I still think, at that stage, her vomiting was standard, 8 normal post-operative vomiting.
- 9 Q. Later on, she carries on vomiting, and we get to a point
- 10 after lunchtime really when the nurses in the
- 11 mid-afternoon are thinking that they might want some
- 12 assistance with the vomiting and, ultimately, they get
- 13 that assistance when Dr Devlin arrives at 6 o'clock and
- 14 he administers an anti-emetic. By that stage, would you
- 15 have wanted there to be any more senior involvement?
- 16 A. I suspect not at that stage. Her vomiting for the
- 17 first -- through the morning, it was clear it was
- 18 post-operative vomiting. She had, according to the
- 19 fluid balance chart, a single vomit at 3 o'clock in the
- 20 afternoon; is that correct?
- 21 Q. No.
- 22 THE CHAIRMAN: I'm afraid this is where the fluid balance
- 23 chart begins to become unreliable.
- 24 A. I appreciate that fully. But in terms of the evidence
- 25 that Dr Devlin might have known at that stage.

- 1 MS ANYADIKE-DANES: Ah, yes. If you were to combine the
- 2 evidence, not all of which is reflected on the fluid
- balance chart, if you did that -- in fact, we might pull
- this up, which might help. We have compiled a timeline
- to try and assist with showing some of this. If we pull
- up 312-001-001. I take it you haven't seen this before?
- 7 A. No.

5

6

15

- 8 Q. Let me very quickly show you what's going on here so
- that you can understand it. Along the bottom,
- 10 obviously, is the time. Along the top are the periods
- 11 of time when people were with Raychel, so you can see
- 12 the nurses and also when her parents were actually
- 13 there. The two blue lines going diagonally from left to
- 14 right are the fluid lines: the cumulative total is the
 - one that's closer to the top because that takes account
- 16 of the Hartmann's that she received; the one at the
- 17 bottom is the Solution No. 18. And those initials are
- 18 the initials of the nurses who were recording the amount
- 19 that she received every hour. Do you see that on the
 - bottom line?
- 21 A. Yes.
- 22 $\,$ Q. Then on the top one, you can see the vomits. So the
- 23 yellow circle is a vomit that is recorded, not
- 24 necessarily on the fluid balance chart, but somewhere in
- 25 her charts. And the red ones are vomits that other

1		people have referred to as having taken place.
2	A.	Yes.
3	Q.	In the red writing, that is who has recorded or where
4		it is. In fact, actually, I think all the yellow ones
5		are the fluid balance, I beg your pardon. You can see
6		that. So each yellow one is corresponding to a vomit
7		that is recorded on the fluid balance chart.
8	A.	I worked that out.
9	Q.	And the other ones are just reference to whomsoever
10		it is has described a vomit as having taken place and
11		we have some sort of evidence for that. And then you
12		see the volume, however that is described and recorded,
13		we've tried to refer to it there. Okay? And then you
14		can also see the other events that happen during the day
15		to Raychel, the various attendances, the changes in the
16		bag and so on. Okay?
17	A.	Yes, that's fine.
18	Q.	So then working on the yellows. When you said what
19		would have been recorded for him to see, the yellows are
20		on the fluid balance chart. So when Dr Devlin attends,
21		you can see that marked at 1800 hours, you can see that
22		at that stage she has had four vomits that are recorded
23		on the fluid balance chart.
24	A.	Yes.
25	Q.	And according to the parents although there is some

would have wanted some more senior intervention at that

- difference about this -- and other witnesses, she is
- 2 listless at that stage and not as active as she
- previously was. In fact, not active at all really. So
- that is the evidence that might have been told to
- Dr Devlin. If you had seen that, as you can see when
- her IV fluid administration starts, recognised that she
- had been on this Solution No. 18 -- barring the period
- of time when she was on Hartmann's -- all that time,
- would you have wanted some more senior involvement in
- 10 Raychel's care at 1800 hours?
- 11 A. If I'd known that there were seven vomits by that stage.
- 12 Q. You would have?
- 13 A. Yes.

1

8

- 14 Q. I put a similar question to Mr Makar and he said,
- 15 absolutely, he would have wanted to know that and if
- 16 he had known that, he had have gone down and examined
- 17 Raychel himself to see why it was that she was not
- 18 continuing on the path that he had thought she was on,
- 19 namely on her way to being discharged the next day and
- 20 certainly up and about and having a light meal. None of
- 21 that is reflected in the records and he'd have wanted to
 - find out why. He also said, having examined her, he
 - would have contacted his registrar to say this is where
- 24 we are.

22

23

25

1

2

7

8

9

So from your answer, you're in agreement that you

150

- stage? 2 3 A. I think if we had known that there were seven vomits at that stage, that would be reasonable. 4 5 THE CHAIRMAN: The only difference, Mr Gilliland is this: 6 the only difference is between 7 and 5. Because one of 7 the ones that doesn't appear on the fluid balance chart 8 is the one which Dr Devlin himself saw. There are only two below that, which are noted by Mrs Ferguson. 10 A. Sure. 11 THE CHAIRMAN: So even if Dr Devlin went by the fluid 12 balance chart, had he looked at it, and took account of the vomit in his presence, that would bring you to 5. 13 14 A. That's true. The first two of three of which probably -- the first four of which were almost 15 16 certainly standard post-operative vomiting because 17 that's when Raychel vomited up some food, if I recall 18 correctly.
- 19 THE CHAIRMAN: Then there's a 3 o'clock vomit and
- 20 a 6 o'clock vomit.

- 21 A. Yes. And we do not know the size of that and Dr Devlin
- 22 witnessed that himself.
- 23 MS ANYADIKE-DANES: In any event, in terms of the vomiting
- 24 continuing that way, you characterised the one that
- 25 would have happened at 1 o'clock as discharging the

- contents of her stomach, which is perhaps the last part
- of what had started at 8 o'clock in the morning, if I
- 3 can put it that way.
- 4 A. I think that's correct.
- 5 Q. Then that's gone and she vomits again at 3 o'clock and 6 then Dr Devlin himself notes another vomit. So in those
 - circumstances, would you have expected Dr Devlin to have communicated with his senior colleague, the SHO, and
- said, "This is where I am, this is what's happening,
- 10 what should I do?"
- 11 A. I think a couple of things there. If we are agreed that 12 the vomiting up until in and around 1 o'clock was --
- Q. I'm not in a position to agree that; I'm just hearing
 your evidence on it.
- 15 A. If that is my understanding, then there's only a couple 16 of vomits after that time. I'm not sure that I would 17 have expected Dr Devlin, if no concern had been
- 18 expressed to him by any member of the nursing staff and
- 19 if he had found Raychel not to be in a condition which
- 20 was causing him concern -- I'm not sure at that stage
- 21 that I would necessarily have expected him to call
- 22 someone.
- 23 Q. Now that you've got it as Dr Devlin, it may be his24 experience to be able to characterise those vomits, as
- 25 up to 1 o'clock, as not being too problematic because

1		they're only post-operative vomits that you might
2		reasonably expect and then we've got these two others,
3		well, maybe we'll just wait and see. You might be able
4		to do that and have the experience to do that, an SHO
5		might be able to do that, but Dr Devlin, that might be
б		a little much to ask him to be able to exercise that
7		kind of judgment.
8	A.	I don't think anyone would have been able to do that
9		because the only people who could have told us that were
10		the members of the nursing staff because they were the
11		only ones who could have told us that this was still
12		food that she was vomiting in and around
13	Q.	Yes, but
14	A.	It's the character of the vomit we're talking about
15		here. The fact that she was vomiting food from the
16		night before suggests that this was simple gastric
17		stasis up until that point. Thereafter, there may well
18		have been an issue.
19	Q.	What if they haven't told him the character? He's just
20		looked at the fluid balance sheet and noted there have
21		been four vomits there and now she's vomited again in
21 22		been four vomits there and now she's vomited again in front of me. So he knows nothing about the character of
		-
22		front of me. So he knows nothing about the character of

more senior?

1

6

16

17

18 19

21

22

- 2 A. Well, again, that's where we come back to "What is
 - pathological vomiting?", and again I think a JHO would
 - be very much dependent on advice from experienced
 - nursing staff to know if this vomiting, in their
 - experience, was out of keeping with what they would normally expect.
- 8 THE CHAIRMAN: At the very least or at the absolute minimum.
- this shows the need for Dr Devlin to have spoken to the
- 10 nurses when he was on the ward?
- 11 A. I was aware that he did speak to them, as far as --
- 12 THE CHAIRMAN: Well, there's a concern for Dr Devlin and for 13 Dr Curran about them being bleeped, about them speaking
- 14 on the phone, and then coming to the ward. It does
- 15 rather seem that the amount of direct contact which they
 - had with the nurses when they were on the ward was
 - minimal. So for instance, there was not a nurse with
 - either of them when he [sic] saw Raychel. So if there
 - was any discussion about how sick she was or how large
- 20 her vomits had been, the maximum information he would
 - have got was what was on the fluid balance chart
 - As I understand it, it has been pretty much accepted
- 23 by the nurses and the doctors who have given evidence
- 24 that that's a rather unhappy situation which you try to
- 25 avoid. If a doctor's called to the ward to see a child,

154

3 A. Certainly if there's concern and they're being called to come and see a child, to assess a child that there's 4 concern about. If they're being called to do a simple 5 6 task such as administer an antibiotic, administer analgesia, administer an anti-emetic, then that may not 8 be necessary for a nurse to go with him. But if there's concern and they're being called to assess a child, yes, 10 I think that's a different situation. 11 THE CHAIRMAN: That leads on into another issue. There's 12 certainly an interpretation of the evidence which is open to me that all they were being asked to do by the 13 nurses was to give an anti-emetic. But the nurses say, 14 "No, that's not right". Their view is that when the 15 16 doctors were called, they expected the doctors to 17 examine and assess Raychel. There's a clear difference

it's much preferable that the doctor sees the child with

the nurse who has called him to the ward.

18 there.

2

- 19 A. There is.
- 20 THE CHAIRMAN: And if you bring in two young doctors, to be
- fair to them they're JHOs, and I think in both cases the 21
- 22 anti-emetic was effectively left sitting for them to
- 23 administer. So they take that as a fairly strong steer
- 24 to give the anti-emetic. It's possible that they did
- 25 very little beyond that --

1 A. Yes.

5

6

8

10

12

- 2 THE CHAIRMAN: -- because they were taking the steer from
- the nurses. But while you want the doctors and nurses 3
- to work together, is that appropriate? Sorry, is it 4
 - appropriate for the nurses to expect that the junior
- doctors will carry out some form of assessment or
- examination as well as giving the drug or before giving the drug?
- 9 A. I think that depends on the information that is passed.
- If I was called as a JHO simply to give an anti-emetic
- 11 by experienced nursing staff, I suspect that that's what
 - I would have done. But if there's concern expressed,
- then you would be expected to assess the patient. 13
- 14 THE CHAIRMAN: Right. So you say that the doctor then
- 15 depends on the nurse to express concern?
- 16 A. A JHO, as we've said already, or pre-registration, they
- 17 sometimes require some quidance.
- 18 THE CHAIRMAN: Thank you.
- 19 MS ANYADIKE-DANES: Just on that very point as to what you 20 might reasonably expect the nurses to be doing -- we're
- 21 going to come on to the whole issue of post-operative
- 22 nausea and vomiting later on, but now that you have
- mentioned it in that way, it might make more sense to 23
 - deal with it now.
- 24
 - Sister Millar was asked about her concerns and she

1	says that she expressed them in the critical incident
2	review meeting. But in addition to that, she then
3	reiterated them in her evidence. It's the transcript of
4	1 March, page 58. If you can see, she starts at about
5	line 7. She's really dealing with the responsibility
6	and the accessibility of the surgeons and so forth for
7	the paediatric surgical patients. She says:
8	"I said [referring to what she said during the
9	meeting] it was totally unfair that the nurses had such
10	responsibility for the surgical children. I felt it was
11	unfair. I felt that we had to be the lead all the time
12	in looking after the surgical children. We are nurses,
13	we're not doctors. And whilst we do our very best,
14	I don't think we should be prompting doctors. We would
15	now maybe, but 12 years ago Or I don't think we
16	should be telling a doctor to do electrolytes. It's
17	different now, we're more knowledgable, we've had quite
18	a bit of education. But in those days, really, we were
19	leading the care, I feel, in looking after children."
20	So what she's really saying is that she does not
21	believe the responsibility should have fallen to the
22	nurses, or at least the nurses alone, and Staff Nurse
23	Noble and I think Staff Nurse Gilchrist in their
24	evidence said they would expect, if they had called
25	a doctor to a patient, that that doctor would carry out

- his or her own examination of the patient and look
- at the notes. Because whatever they're going to do is
- a matter, ultimately, of their own judgment and so
- whatever one might say that the nurses should do, the
- doctors have their own responsibility to carry out an
- assessment. Would you accept that it's not just for the nurses to point things out?
- 8 A. Absolutely. I wouldn't expect the nursing staff to lead care in the way that sister is perhaps referring to
- 10 there:

1

2

6

9

11

12

13

14

17

19

- "I don't think we should be telling a doctor to do electrolytes."
- I don't think that's necessarily a nurse's job. And you are quite right that any doctor who makes
- 15 a prescription is responsible for that prescription and
- therefore, if they feel that that's not an appropriate 16
 - thing to do or they feel something else needs to be done
- before they make that prescription, then they have 18
 - a duty of care to do that. But I think it is the
- 20 nurse's responsibility to point out to a JHO that they
- 21 feel they have a sick child
- 22 $\,$ Q. They might have thought that by telling the JHO that we
- 23 need an anti-emetic, what they were really communicating
- to that JHO is not only that this child has been 24
- 25 vomiting, but presumably they believe that that vomiting

158

- 1 is going to continue, otherwise you don't need the
- anti-emetic. So they've asked the JHO -- it turned out 2
- to be the JHO -- to come in those circumstances. And 3
- the point that I'm asking you is: given what was on the 4
- 5 record, if I can put it that way, in relation to
- 6 Raychel's care, would you have wanted someone more
- senior to be involved in Raychel's care at that point?
- 8 A. I don't think at that point I would have wanted someone more senior at that point.
- 10 Q. Then were you satisfied with what was actually done at 11 that point?
- 12 A. With the knowledge that Dr Devlin had at that stage?
- 13 Q. No, were you satisfied with what was actually done at
- 14 that point? 15 A. To give an anti-emetic at that point?
- 16 Q. Yes.
- 17 A. I thought that was not unreasonable.
- 18 Q. And what Dr Devlin did is he gave an anti-emetic, he did
- 19 not insert that into her notes, the fact that he had
- 20 done that, although obviously there's a prescription of
- 21 it. There's no time as to that prescription. So
- 22 anybody coming afterwards, if they just read the charts,
- 23 would not be aware that she had received an anti-emetic.
- 24 And even if they looked at the index which showed the
- 25 anti-emetic, I don't believe that that was timed so that

- nobody would be able to correlate that in relation to
- any subsequent vomiting. Would you have been satisfied
- with that as a state of affairs?
- 4 A. No, that's not appropriate.
- 6 A. No. I think that's already -- Dr Devlin, I think, has
- already given evidence with regard to that, that it 8 wasn't appropriately timed.
- 9 Q. In general terms, if he had timed it and if he had
- 10 entered into the notes that he had done that, were you 11 content that Raychel's condition, in terms of its
- 12 description, went no higher than his experience and
- a record in the notes that he had administered an 13 14 anti-emetic?
- 15 A. Well, I think -- I'm not sure that I would have 16 necessarily expected him to put an entry into the notes
- 17 if all he had done was prescribe an anti-emetic as
 - requested to do so. If he hadn't assessed Raychel,
- 19 I wouldn't have necessarily expected him to make a note.
- 20 THE CHAIRMAN: He should have recorded the vomit, should he? 21 A. It would be very uncommon for any doctor to record the
- 22 vomit. He might have told --
- 23 THE CHAIRMAN: Yes, but if he doesn't record it and he
- doesn't see a nurse on the way out, it means it goes 24 25 unrecorded.

2

1

18

5 Q. Not appropriate?

A. That is correct, and there's a problem with how it's
recorded. I have never, I don't think, ever written
"vomit" on a fluid balance chart, but someone needed to
know and record that.
THE CHAIRMAN: Does it not also emphasise the fact that
I'm not picking on Dr Devlin on this because there's all
the caveats about his lack of experience but the
situation which he found himself in appears to be that
there's minimal, if any, contact between Dr Devlin and
any nurse after he has seen Raychel.
A. Yes.
THE CHAIRMAN: And after he has given the anti-emetic, I am
not sure there's any recorded message passed on that
there was another vomit.
A. There needed to be a record made of the further vomit on
the fluid balance chart would be my contention. I don't
think that necessarily would be recorded in the notes
per se.
THE CHAIRMAN: The important thing is to record it
somewhere, isn't it?
A. It is.
MS ANYADIKE-DANES: And you have described the nurses as
being experienced nurses, so even though the full
responsibility, if I can put it that way, for assessing
what Raychel's condition was at that time and

- determining what to do -- you don't say that they bear
- it, but nonetheless, I think your view is that they, as
- experienced children's nurses, should have been giving
- information to the JHO, perhaps even, if they thought
- that there was a concern, suggesting that he contact
- a more senior colleague?
- 7 A. If they felt there was a concern, yes, I would expect that to be expressed.
- 9 Q. Quite apart from the fact that when we were talking
 - about it from the point of view of the JHO, I think you recognised that whether they believe they should be
- 12 contacting a more senior colleague rather came down to
- 13 whether they had sufficient experience to realise that
- 14 Raychel was in a potentially serious situation. That
- 15 required them to appreciate that, which they may not be
- able to. That's when it becomes important that they 16
 - have access to the nurses, perhaps, who have greater
 - experience and can guide them in that; do you accept
 - that?

1

2

6

8

10

11

17

18

19

1

8

17

- 20 A. I accept what.
- 21 0. That of course means that the nurses have to recognise 22 that this is a potentially serious situation. If the
- 23 nurses don't appreciate that that level of vomiting can
- 24 be characterised as vomiting that should or could give
- 25 rise to concern, then you've got nurses who don't have

- 1 enough knowledge maybe to know that and JHOs who perhaps
- don't have enough experience to know that. And that 2
- might be a problem in certain circumstances. 3
- 4 A. In certain circumstances that could be a problem, but
- 5 the nurses were extremely experienced and dealt with
- 6 lots and lots of children post-operatively.
- 7 O. Yes.
- 8 A. We would have -- if they had concerns, I would have
- expected that they would have expressed them.
- 10 Q. I think that there has been no doubt that if anybody had
- 11 a concern, they would have been wanting to act on that
- 12 concern. The area that ${\tt I}^{\,\prime}{\tt m}$ with you is whether they are
- 13 in a position to recognise that they should be having
- concerns, and the reason why I put it in that way to you 14
- 15 is that for quite some time the nurses were not
- 16 recognising, even after she had suffered her collapse,
- 17 that Raychel had had severe and prolonged vomiting. In
- 18 fact, that was a position that not only they took. So
- 19 if they are not in a position to recognise that, then
- 20 they're not in a position to assist very inexperienced 21
- JHOs to say, "Look, this vomiting is potentially
- 22 problematic and you really need to be getting in touch 23 with your SHO".
- 24 A. It's precisely why we've put in place a protocol to
- ensure that that didn't happen again, rather than leave 25

- it to -- I didn't want to use the word "chance", but if
- you understand what I mean, rather than leave it to the 2
- inexperience of a JHO or the perhaps lack of
- appreciation of nursing staff, that is why a structure
- has been put in place in order to minimise that risk and to prevent it from happening.
- 7 Q. And we will pick up on that later and possibly more so
 - even in governance. But that was recognising, when
 - I had put to you before that there were potential flaws
- 10 in the system, that's one of them?
- 11 A. Yes, if there weren't flaws in the system, we wouldn't 12 have put a protocol in place.
- 13 Q. But that is a flaw in it. Then you were helping me with when you would have wanted more senior intervention. So 14
- 15 the 6 o'clock, it's unclear, unless someone had
- 16 expressed a concern. I think you have recognised that
 - maybe two of those vomits maybe were no longer
- 18 post-operative vomiting, but it's unclear.
- 19 A. It's unclear.
- 20 Q. Then if we move on and she's had that anti-emetic and it
- 21 hasn't completely resolved the situation. In fact, you
- 22 can see that she does go on to vomit again and there's
- another vomit that's recorded on the fluid balance 23
- 24 chart. We've got Dr Devlin's vomit there at 6, then
- there seems to be another vomit there, and then you see 25

1	the	first	post-emetic	fluid	balance	chart	vomit

- happening at 9 o'clock. And that vomit --2
- 3 A. Sorry, I don't have it up at the moment.
- 4 Q. I beg your pardon. Do you see that there at 9 o'clock?
- There's a yellow circle indicating a recorded vomit.
- 6 A. Yes.
- 7 Q. And that one is recorded as having coffee grounds in it.
- 8 A. Yes.
- 9 0. Then Dr Curran attends and he attends at 10 o'clock, as
- 10 you can see, and there's another vomit round about that
- 11 time, recorded as having coffee grounds.
- 12 A. Mm-hm.
- 13 Q. If the JHO -- this is now a different JHO -- and for
- 14 reasons which you know because, in terms of the way the
- 15 note was kept, is not in a position to see these vomits
- in the context of when the anti-emetic was administered. 16 And he doesn't know anything about Raychel, but he turns
- up. Would you have wanted at that stage some more 18
- 19 senior involvement?
- 20 A. Yes.

- 21 O. And why is that, Mr Gilliland?
- 22 A. I think at that stage you are concerned about a child
- who has vomited seven times at that stage and we're now 23
- 24 beyond 12 hours following her surgery. There's the
- 25 issue about coffee grounds, which I think can be

165

- variably interpreted and I'm sure you've heard various
- interpretations so far. If it's true coffee grounds, it 2
- indicates that she has had some blood in her stomach,
- which is altered by gastric acid. It could simply be
- a reflection of a single forced vomit or a single retch.
- It doesn't necessarily relate to prolonged or severe
- vomiting, but that would cause some concern. But it's
- more the number and the prolonged nature of her vomiting at that stage.
- 10 $\,$ Q. And when you say you would have wanted more senior $\,$
 - involvement at that stage, what would that involve so
 - far as you're concerned? What would you have wanted to have happened?
- 14 A. What I would have wanted to happen at that stage?
- 15

1

8

11

12

13

17

- 16 A. I think at that stage it would have been helpful for
 - someone to assess and examine Raychel, although I don't
- think they would have found any particular findings that 18
- 19 would have helped them. In my view, the only thing that 20 would have helped here would to do a U&E at this stage.
- 21 Q. Can we pause there. As we're talking now about senior
- 22 involvement, when you say "someone", who did have in 23 mind?
- 24 A. The SHO.
- 25 Q. So an SHO should come. We have --

166

- 1 A. That's the first port of call.
- 2 O. Mr Zafar has given his evidence in his evidence he would
- have wanted to come at 6 o'clock, as you know. He 3
- definitely would have wanted to come at this stage and 4
- 5 he said he would have done all the things that he
- 6 explained he would have done at 6 o'clock, but with
- perhaps greater urgency. And he would have notified his registrar 8
- Mr Bhalla's evidence is that he would have come and
- 10 carried out his own examination of Raychel, had he been
- 11 notified about the things that we're just seeing here
- 12 and he would have wanted certain tests done, he would
- have wanted to know what her electrolytes were, he would 13
- have wanted to do an overall review of Raychel, and he 14
- said he would have stayed there until those results came 15
- 16 back so that he could have a closer involvement in her
- 17 care because he would have been concerned at that stage.
- 18 A. I have to accept his evidence. I think it's
- 19 speculation, looking back and saying what anyone would 20 have done in 2001.
- 21 Q. Understood. If I put it in a slightly different way,
- 22 what would you have wanted to have happened for Raychel?
- 23 The SHO, you said, was to be contacted. What would
- you have wanted to have happened once the SHO arrived? 24
- 25 A. When the SHO arrived, I would have expected him to

- assess Raychel, to examine her and specifically to do 1
- a U&E at that stage. 2
- 3 THE CHAIRMAN: Within about 30 minutes or so, you'd expect the U&E result to come back.
- 5 A. If it was sent urgently to the lab, you'd expect it to be back in 30, 45 minutes.
 - THE CHAIRMAN: It's reasonable on this hypothesis to expect that it would have shown a falling or plummeting sodium
- level.

8

15

16

- 10 A. That is correct.
- 11 THE CHAIRMAN: And at that point the SHO would absolutely 12 call a registrar?
- 13 A. I would have thought Mr Zafar would have called
- a registrar, judging by his level of experience that 14
 - we've already heard about and judging by some of the
 - things he said in evidence. I'm sure he would have
 - called a registrar. I suspect he might have called
- 18 a paediatric registrar or SHO.
- 19 THE CHAIRMAN: Let's assume for these purposes that at that 20
- point the sodium level is somewhere in the 120s. Even if it's high 120s, if it's 127 or 128. Is that the 21
- 22 territory at which it might be appropriate to call you 23 or not?
- 24 A. I don't know that it would necessarily have been
- appropriate to call me. If someone had phoned me with 25

- 1 that, I would probably have suggested to them that they
- 2 speak directly to a medical paediatric registrar.
- 3 $$\rm I$ would certainly have wanted to have known about that,
- 4 but with regard to who would be the best people to
- 5 intervene and correct that, it might be the paediatric
- 6 registrar. They certainly would have made some
- 7 management changes.
- 8 MS ANYADIKE-DANES: Does that mean that you would have
- 9 wanted to know that the SHO had been called at that
- 10 stage and maybe was referring it to either a more senior
- 11 colleague or a paediatrician for advice?
- 12 A. I think I would have wanted to know that her sodium had,
- 13 as the chairman had put it, plummeted, and that
- 14 measures were being taken to correct that.
- 15 Q. If the SHO had not been able to contact his registrar
- 16 and hadn't been readily available to contact
- 17 a paediatrician and had reached you directly, which
- 18 I think you have said is something that is open to them
- 19 to do if they want some guidance, what is the advice
- 20 that you would have given at that stage?
- 21 A. I think the advice I would have given at that stage
- 22 would be to stop the No. 18 Solution and put up a drip 23 containing either Hartmann's or saline.
- 24 Q. And why's that?
- 25 A. Because of her falling sodium.

- 1 Q. So that would have been in recognition that her falling
- 2 sodium, which is likely to have been produced by her
- vomiting -- nothing else has happened that would have
- affected her -- or would you have thought that anything else was happening?
- eise was nappening

8

15

- 6 A. I'm not sure that at that stage I would have thought 7 that anything else had happened, but I'm not sure that
 - her vomiting is entirely responsible for her falling
- 10 Q. What would you have thought? Well, then, what you have 11 thought was going on at that stage?
- 12 A. I'm not entirely sure that I would have been aware of 13 what was going on, except we had a child who had
- 14 a falling sodium. I'm not sure I would have worked out
 - at that stage that this was dilutional hyponatraemia
- 16 in relation to ADH, but it would be clear that something 17 significant was going on.
- 18 Q. But presumably you would want to know why her sodium was 19 falling?
- 20 A. Yes, you would.
- 21 Q. And from your point of view, what are the candidates for 22 why her sodium would be falling?
- 23 A. I think the most obvious thing that you would have
- 24 thought of at that stage was the fact that the child was 25 vomiting.

170

- 1 Q. So that means what you would have been recognising in
- 2 giving that advice is the child's vomiting, she's losing
- 3 sodium, as it were, the only drip she's got up is giving
- 4 her something low in sodium, that's not appropriate,
- 5 what we need to do is improve the sodium balance in her
- 6 body --
- 7 A. Yes.

8 Q. -- so give her a fluid that's got more sodium. Is that

- 9 the logic of it?
- 10 A. That would be reasonable logic.
- 11 Q. And so although, when I was asking you earlier about
- 12 dilutional hyponatraemia, you were saying you hadn't got 13 very much experience about that and hypotonic fluids.
- 14 In fact, by force of logic, you'd have worked out what
- 15 ought to happen in such a circumstance?
- 16 A. Where you have a figure in front of you, you have done a
- 17 U&E, you see the low sodium, it's clearly fallen very
- 18 significantly from a normal level just a number of hours
- 19 earlier, whenever she was admitted, so you would know
- 20 that that would need to be addressed.
- 21 Q. Yes. You say that one of the fluids that you might have
- 22 suggested they use is Hartmann's.
- 23 A. Yes.
- 24 Q. Were you aware that there was -- maybe "protocol" is too
- 25 strong a word -- that there was a practice on Ward 6

- 1 that the solution to be used with all the paediatric
 - patients, whether they were surgical or not, was
- 5 Q. Were you also aware, as it seems to have turned out in 6 the evidence, that if a different solution was
 - prescribed, that that was routinely or very often simply
 - changed and Solution No. 18 substituted?
- 9 A. No.
- 10 Q. You weren't aware of that?
- 11 A. No. And I think that's obvious from the -- number 1, 12 I was not aware of it, and it would appear that that
- 12 I was not aware of it, and it would appear that that was 13 not widely appreciated amongst the surgeons and
- 14 anaesthetists within the hospital. Hence there's a memo
- 15 from Dr Nesbitt to Mr Bateson, the clinical director of 16 surgery, saying that this seems to be the practice.
- 17 Q. Actually, Dr Jamison seems to know that happened, an
- anaesthetist.
- 19 A. She's a junior anaesthetist. The junior anaesthetists
- 20 may have been aware of that, but it would appear that 21 the consultant anaesthetists and consultant surgeons
- 22 were not aware of that practice.
- 23 $\,$ Q. Is that something that you would have wanted to be drawn
- 24 to your attention that that was happening?
- 25 A. You would probably want to know that, yes.

3 Solution No. 18?4 A. Yes.

2

8

odium balance in her 5 Q. We 6 th

- 1 Q. You would have wanted to know?
- 2 A. Yes.
- 3 0. The other thing that seems to have been a practice
- is that if there was a preoperative prescription for
- fluids, as there was actually in this case for
- Raychel -- in fact, Mr Makar had wanted Hartmann's, but
- he was disabused of that notion and he ultimately wrote
- 8 up a prescription for Solution No. 18. That solution
- with that rate, which from his point of view had been
- 10 calculated to reflect her state and condition at that
- 11 time, was simply reinstated as something that was
- 12 described as being fairly normal and routine after the 13 operation and it's that that continued on through until
- 14 as changed some time after her seizure. Did you
- 15 know that that was the practice?
- 16 A. We did not know that that was the practice at that 17 stage.
- 18 Q. Would you have wanted to know that that sort of thing 19 happened?
- 20 A. Again, I think we would have wanted to have known about
- 21 that, but the frailties of that system were only exposed 22 by Raychel's tragic death.
- 23 Q. But does it not become obvious in a way when one carries
- 24 out one's ward round and one looks at the charts of
- 25 children that this is the fluid that's being used?

stage, that's a preoperative prescription.

1

173

- 1 A. No. Oh, the fluid that's being used?
- 2 Q. Yes, and the rate that's being used.

6

12

- 3 A. You'd know the rate and you'd know the fluid that was
- being used because you would see that on the chart. But
- I think what you're asking me is how would I know from
- looking at the fluid chart that this was the practice.
- Q. No, the individual doctors would know that. That's why
- 8 I'm asking if you would have expected it to be brought
 - to your attention. An individual doctor would know that
- 10 they had been prescribed a particular fluid at
- 11 a particular rate preoperatively and would know,
 - post-operatively, without there being any fresh
- 13 prescription, that that rate seems to have carried out?
- 14 A. I'm not sure that an individual doctor would necessarily 15 have picked that up. It wouldn't necessarily have been
- the doctor who had done the initial prescription who 16 would be doing the ward round the next morning. 17
- 18 Q. But would it not be clear that there is no fresh
- prescription? If we look, for example, at Raychel's 19
- 20 charts, it's very clear the prescription that Mr Makar
- 21 makes. It's 020-021-040. It's guite clearly
- 22 a preoperative prescription. You can see his 80 ml
- an hour, No. 18, he's signed it and the time it's 23
- erected is 10.15, the nurse has signed it. So given 24
- 25 that it's known that she hadn't had her surgery at that

174

- 2 A. Yes. 3 Q. And then, in fact, what is stroked through is actually 4 a prescription that Dr Gund wanted to make, but he was 5 disabused of that notion also. So in terms of looking 6 at: well, she's on Solution No. 18, that 80 ml a hour seems rather high, I wonder where that comes from. If 8 you had look back in your charts, the only prescription you would have seen is a preoperative prescription. 10 A. Yes, but the question is why would one look back through 11 her charts? I have thought about this a little bit. If 12 a child goes to theatre in the afternoon or during the day and has her appendix out, it's very likely, by the 13 following morning, that that child will already have 14 their IV fluids discontinued and will be on an oral 15 16 intake. And therefore there would be no reason to look 17 through the chart to see exactly who prescribed and how 18 did that come about. 19 O. Not in that scenario. 20 A. Not in that scenario. And similarly, in a scenario that 21 we find here, where a child went to theatre in the late 22 evening or early hours of the morning, the following 23 morning a fluid prescription is in place, the 24 anticipation is that the fluid will be taken down.
- 25 I don't think that I would have looked back through the

- chart and try to work out where exactly did this prescription come from. 2
- 3 Q. Not at the ward round? Because I think you're right,
- Mr Zafar's view was, no, I wouldn't have done that
- because in my view she was going to come off those
- fluids so I wasn't really that concerned about it. But
- he did say that when matters continued on and she
- deteriorated in the way that he had not anticipated,
- then he would have come and assessed her and looked at
- her charts. One of the queries you might have is, "Why
- 11 is she on 80 ml an hour?", which you have recognised is 12
 - higher than her maintenance level. And you might have
 - looked to see the prescription, who prescribed that, and
- then you could have a quick word with them and say, 14
- "What led you to prescribe that?" And if you had done 15 16 that, which doesn't seem an unusual scenario, you would
 - have seen that there is actually no prescription for
 - that rate.

5

8

10

13

17

18

- 19 A. Absolutely, and that's exactly what we found out in this
- 20 case. Before that, I don't think anyone had worked that out, that this is what was happening.
- 21
- 22 Q. As it happened, that's what happened in Raychel. I'm suggesting that it's not so completely unusual to have 23
 - a situation where you want to clarify why a child is on
- 25 a particular rate and all I'm saying is: if you had done

1 that in relation to a post-operative paediatric ca
--

- you might find that there is no post-operative 2
- prescription.
- A. But you'd only have again queried that if you were
- concerned about the rate, if the rate was calculated 6 incorrectly.
- 7 Q. Of course. Am I to understand from what you are saying
- 8 that, in one way or another, it had not been brought to
- your attention that that is a practice that the nurses
- 10 were engaging in?
- 11 A That's correct
- 12 MR STITT: It's only fair to say, if I may -- I hope it's
- 13 the end of this particular line of questioning, maybe
- 14 it's not -- that whilst the witness has said he w
- 15 unaware and generally his colleagues were unaware, it 16
- must be, in fairness, set against a background of a long period of treatment of patients, many of whom were 17
- children, without any adverse outcomes in the 18
- 19 Altnagelvin Hospital. And these questions are being
- 20 asked, guite properly asked, but asked nonetheless after
- 21 the loss of Raychel and some 10 years later
- 22 THE CHAIRMAN: Sorry, Mr Stitt, that's a submission point.
- 23 It's not appropriate to make it and the issue is that
- 24 the surgeons were told about this. The junior surgeons
- were told about this at the time. It is odd in the

- extreme that the surgeons, such as the surgeon who
- performed the operation on Raychel, were somehow

2

8

- oblivious to a system which meant that the preoperative
- fluids became the post-operative fluids, a system which
- I think was recognised within Altnagelvin in the
- aftermath as being inappropriate and is recognised by
- the experts as being inappropriate.
- What I would like your help with, Mr Gilliland, is where on earth this practice came from?
- 10 MR STITT: I accept that point, but my point is a slightly 11 different one. The witness has said that he was not
- 12 aware and his colleagues were not aware, just as Mr
- 13 Makar was not aware. The further enquiry as to why they 14 ere not aware is maybe a different issue.
- 15 THE CHAIRMAN: Were you able to find out afterwards where 16 this practice came from?
- A. I don't think anyone was able to find out. That's why 17 it was couched in the way that Dr Nesbitt couched it to 18
- Mr Bateson that "this seemed to be the practice", "it 19
- 20 seemed to have developed", but I don't know that I know
- 21 where it came from 22 THE CHAIRMAN: On my understanding of the evidence that we
- 23
- heard from some of the nurses, if a child came back on,
- 24 say, Hartmann's, then they would have to answer to
- 25 sister for the fact that a child was on Hartmann's

178

3 THE CHAIRMAN: Was that as a result of any discussion between -- I think Mr Bateson was the head of surgery at 4 5 that time. 6 A. He was the clinical director.

2 A. I'd read that, yes.

rather than Solution No. 18.

- 7 THE CHAIRMAN: Do you know if that was as a result of any
- 8 discussion between Mr Bateson and the nursing staff?
- 9 A. Not that I'm aware of. Mr Bateson is deceased though.
- 10 THE CHAIRMAN: And if it had been, it might have been
- 11 something you were aware of through Mr Bateson?
- 12 A. Probably. There were clinical director meetings where
- we might have discussed that issue. 13

THE CHAIRMAN: Thank you. 14

- MR QUINN: The parents would want this particular point 15
- 16 covered completely. Does that mean that when this
- 17 particular doctor comes for a ward round, say two days
- 18 after surgery, and someone for some reason is still on
- 19 intravenous fluids that he wouldn't recognise that
- 20 they're on the wrong type of fluid if he prescribed
- 21 Hartmann's after surgery and they were on
- 22 Solution No. 18? Is there no cases that he can think of
- 23 where he has come down on a ward round and sees that the
- 24 wrong solution has been put up?
- 25 A. It wasn't the wrong solution that was put up. No. 18

- was the preferred solution in children for maintenance 1
- That was always the solution that was used. That wasn't 2
- really the issue. And with regard to who made the
- post-operative prescription, that would very rarely be
- 5 myself because it would normally be the anaesthetist
- post-operatively. We understood they were the ones who
- would have done that, but as it turns out it may have
- 8 been a surgeon from a preoperative point of view.
- MS ANYADIKE-DANES: Can you help us with this point? In
- 10 Raychel's case, two different doctors formed the
- 11 clinical view that the appropriate solution for her was 12
 - Hartmann's. Mr Makar, as part of the surgical team,
- that's what he thought she should be on, that was his 13
- experience of what was appropriate for her. Dr Gund, 14

15

- the anaesthetist, put her on that during surgery and 16 would have wanted her to carry on with that post-surgery
 - for whatever period of time that the anaesthetist would
- 18 have had control over her fluids in his view. So
- 19 that is what he thought was clinically appropriate for 20 Ravchel.
- 21 The first one, Mr Makar, was invited up to the ward 22 and asked to change it to Solution No. 18. In relation
- to Dr Gund, it was made clear to him that the 23
- anaesthetists didn't do that sort of thing and when 24
- Raychel got on to the ward, she would be addressed there 25

- and hence he left the note "on ward protocol" and what 1
- he understood by "ward protocol" is a little unclear, 2
- but it would seen that the ward protocol was
- Solution No. 18.
- 5 A. Mm-hm.
- 6 Q. So there you have two different clinicians who, in their own clinical judgment, form a view of what your patient
- 8 should have, if I can put it that way, and for various
- reasons it doesn't happen. And it doesn't happen
- 10 because, on Ward 6, they appear to operate a certain
- 11 sort of practice in relation to the fluids. Would you
- 12 not have wanted to know that that is what was going on?
- 13 A. Yes, I think if fluid prescriptions were being changed
- 14 in that way, I think we would have wanted to have known.
- 15 But I understand why Solution No. 18 was the solution 16 that was preferred.
- 17 Q. I understand. I'm not getting into that point in
- particular. This is just a matter of two doctors 18
- thinking this is what they would like this child to have 19
- 20 and it doesn't happen, and I'm asking you -- and I think
- 21 you have given your answer, that you'd have wanted to
- 22 know. Particularly, I presume, if that was a practice
- 23 you would want to know that.
- 24 A. Yes, if that was standard policy within the ward to --
- 25 Q. "Policy" has certain overtones. If that was just the

have known that. That is something that they would have

- 1 practice that happened, you would want to know that?
- 2 A. To change it all of the time?
- 3 Q. Yes.

10

12

20

5

8

10

12

13

16

- A. Although we understand why it was changed all of the
- time to No. 18 Solution.
- 6 Q. You would want to know that?
- A. I think we would want to know that.
- 8 O. Then if I can take it one step further and sav: if that was in fact a practice, so that that is what was
- happening to paediatric surgical patients, should you
- 11 not have known that, that the fluids for paediatric
 - patients were routinely being changed in that way,
- 13 should you not have known that?
- 14 I would have to say that I should have known that.
- 15 Q. Thank you. Who do you think should have had the responsibility for letting you know that that was 16 17 happening?
- 18 A. It's hard to know who should have that responsibility
- because there was, it would appear, no senior person who 19
 - knew that that was happening, according to the memo that
- 21 went from Dr Neshitt to Mr Bateson It would appear
- 22 that this was not a practice that was appreciated by
- 23 either consultant surgeons or consultant anaesthetists.
- 24 Q. But might have been by consultant paediatricians?
- 25 A. I'm not sure that the consultant paediatricians would

- to be asked. I don't know. 2 3 Q. Yes. Thank you. 4 THE CHAIRMAN: That would be really remarkable, wouldn't it, 5 if paediatricians who weren't involved in surgery were 6 overruling the anaesthetists and the surgeons? 7 A. Well, that would be somewhat unusual, but I understand 8 that there was 40 or 50 years of experience with No. 18 Solution and it was strongly preferred in paediatric 10 patients for reasons that I'm sure have been well 11 rehearsed to this inquiry. 12 MS ANYADIKE-DANES: Mr Chairman, I'm being given an indication in relation to a break. 13 14 THE CHAIRMAN: We'll break for 10 minutes for the 15 stenographer and then we'll resume. 16 We won't go beyond 5 o'clock today and if there's 17 a convenient break at some point after 4.30 or 4.45. 18 we'll take that as the end of today. 19 MR STITT: Mr Chairman, might I come back to a point which I raised yesterday? That was to do with Dr McCord and 20 21 the interregnum between his two sets of evidence. Have 22 you had the opportunity yet to reflect on the point? 23 THE CHAIRMAN: I have. Am I right in understanding what
- Dr McCord was considering doing yesterday was giving us 24
- some sort of demonstration? 25

- 1 MR STITT: He was going to deal with a point by way of
- a demonstration, that's correct. 2
- 3 THE CHAIRMAN: Right. I would like an outline from
- Dr McCord of what it is that he wants to demonstrate, 4
- although I think it's now accepted that it's
- inappropriate for him to do a physical demonstration
- in the chamber. I would like an outline of what it is
- that he wants to demonstrate and, if that comes from
- Dr McCord in writing, then I will respond to that and
- e'll formulate it in whatever way is most appropriate.
- 11 MR STITT: I didn't quite pick that up. Are you saying,
 - chairman, that you felt it was inappropriate that he did a demonstration or are you saying --
- THE CHAIRMAN: The view that was expressed to me yesterday 14
- 15 was that it was accepted that it was probably
 - inappropriate for him to do a physical demonstration of
- 17 containers of fluid in the chamber.
- 18 MR STITT: That is part and parcel of what he will be
- 19 presenting to you. It's quite clear that the way this
- inquiry is set up, that evidence is put into the arena 20
- 21 first of all, before it is given, for good reason, so
- 22 that the experts can be aware of it. I would ask you, 23
- however, to keep an open mind, if you wouldn't mind, 24
- in relation to either he or Dr Nesbitt using the
- 25 physical containers to make the point. It may seem

1	simplistic I am alive to that point but that is
2	something which can be dealt with by the experts. On
3	the other hand, I can say, having consulted with
4	Dr McCord, as a layperson, I can see some value in his
5	proposals. I've asked him to put it in writing and
6	I wanted to check with you that, if he had a question to
7	ask of me in relation specifically to that, would there
8	be any objection to me answering that question?
9	THE CHAIRMAN: I would like Dr McCord to put his proposal in
10	writing and for it to come to us and if it could come
11	we'll be here all next week with the various experts.
12	If that could be presented to us next week from
13	Dr McCord in writing about what it is that he is
14	suggesting that he should do, then we can discuss it
15	next week in the chamber.
16	MR STITT: I'll do that.
17	(3.46 pm)
18	(A short break)
19	(3.56 pm)
20	(Delay in proceedings)
21	(4.11 pm)
22	MS ANYADIKE-DANES: After the 10 o'clock intervention, if ${\tt I}$
23	can put it that way, the next time that any clinician
24	sees Raychel is in response to her seizure, which
25	happens at about 3 o'clock in the morning. And as it

that, and that is how Dr Johnston gets involved. So he 2 responds and stabilises her, gives her two sets of medication to addressing the fitting. And then he contacts Dr Curran as the JHO. His evidence is that what he wanted Dr Curran to do is two things, really: 6 one, come and take the bloods and get that sorted out 8 because even without knowing very much about Raychel, 9 Dr Johnston had formed the view that what he might be 10 dealing with here is an electrolyte imbalance --11 A. Mm-hm. 12 Q. So that was one thing he wanted Dr Curran to do. The 13 other thing he wanted Dr Curran to do was to contact his 14 senior colleagues. In fact, if you see from his note 15 that he entered into Raychel's charts, after the event of course, he actually puts in there, 16 "Registrar/consultant review". So that's what he had 17 envisaged happening. The explanation for that is that 18 19 he was very concerned that he was now dealing with 20 a surgical patient, some of this might be something to 21 do with the surgery, he had no idea, and he wanted 22 senior surgical involvement. You may be aware that 23 paediatric SHOs can have quite limited paediatric experience because they don't have the JHO level, if I 24

happens, it's a paediatrician who is proximate to all

can put it that way. So these are all the reasons and 186

that's what Dr Johnston wanted to happen. 2 A. I haven't read his note. Is it clear that it was registrar and consultant surgeon that he wanted --3 4 O. Yes. 5 A. -- to be involved? 6 Q. I can take you to his note. It's at 020-007-013. Down 7 at the bottom there, that's where he says -- ${\tt I}$ think 8 that's "Review by a registrar/consultant". 9 A. Yes. 10 Q. And his evidences has been that that was the senior 11 surgical involvement that he wanted. There's no 12 difference between he and Dr Curran that Dr Johnston wanted senior surgical involvement. Dr Curran's way of 13 achieving that was to contact his SHO, or at least try 14 to contact his SHO. There is a difference between them 15 16 as to whether Dr Johnston understood that he had also 17 made contact with his registrar. That's the difference 18 between them. But what there isn't a difference between 19 them seemingly is that Dr Curran understood that 20 Dr Johnston wanted senior surgical involvement. 21 A. Okay. 22 Q. So now, given that scenario, Dr Curran, of course, 23 responds by going there and takes the blood and so on; 24 would you have wanted to have been notified about that? 25 A. At 3 o'clock in the morning? 187

1 0. Yes.

4

5

6

8

12

13

14

15

16

17

25

- 2 A. No, I don't think I would have wanted to have been
 - notified of that at that particular time. It's also
 - unclear to me as to why Dr Johnston would have wanted
 - a registrar or consultant in surgery. Admittedly, she
 - was a surgical patient, but registrars and consultant
 - surgeons would not be the people who would be best
 - placed to deal with this particular situation.
- 9 Q. His evidence was he was concerned that there was some 10 sort of surgical-related issue that he would not have
- 11 properly grasped and he would want senior surgical
 - involvement. I'm paraphrasing it now, those aren't the exact words he used, but that was the sense of it. His witness statement is at 029/2, page 7, so I don't have
 - to paraphrase it.
 - At (c):
 - "Why do you want the surgical registrar or senior
- 18 house officer to attend? I was concerned that Raychel
- 19 had a serious post-operative surgical cause for her fit
- and deterioration. I wanted more senior surgical 20
- 21 doctors from her team to assess and manage her
- 22 condition."
- 23 A. Okav.
- 24 Q. So that's what he wanted.
- 25 THE CHAIRMAN: Sorry, if you don't think that surgeons would

- be best placed to deal with that situation, are you 1
- 2 saying that's because you thought paediatricians and/or
- anaesthetists were best placed?
- 4 A. If she'd had a fit, that would not be something that
- would come under the normal remit of a surgeon.
- We would feel very, very out of our depth in dealing with that situation.
- 8 THE CHAIRMAN: Well, is it paediatricians or anaesthetists
- or both that you would have thought would have been best 10 placed?
- 11 A. Paediatricians in the first place and then, if she had a
- 12 difficulty with her airway, as clearly she did, that's
- 13 when the anaesthetist would be need to be involved.
- 14 THE CHAIRMAN: Thank you.
- 15 MS ANYADIKE-DANES: That was, in any event, what he had
- communicated to Dr Curran. Dr Curran attends and he can 16
- obviously see that Raychel has collapsed, she's 17
- unconscious and he does what he's asked to do, which is 18
- 19 to set about getting the bloods so her electrolytes can
- 20 be tested. Dr Curran is a very junior member of the 21 surgical team. When he sees that and realises that
- 22 Dr Johnston is very concerned himself and wants senior
- 23 involvement, what would you have wanted Dr Curran to do
- 24
- in those circumstances?
- A. Well, I think he could have done one of two things. I

- think he could have phoned/bleeped the SHO and/or
- registrar or alternatively he could have got Dr Johnston 2
- to contact them. Dr Johnston was the one with the
- senior concerns at that point. As we've already said,
- Dr Curran was a junior SHO [sic] and Dr Johnston might
- well have been able to communicate his concerns better
- to a more senior surgical doctor.
- 8 0. But assuming that Dr Curran is busy doing what he is
 - doing to stabilise Raychel and sort out what the next steps should be --
- 11 A. Therefore he wouldn't be best placed to make the phone 12 call.
- 13 Q. Assuming he's occupied, even if he was going to do that,
- 14 in terms of Dr Curran keeping his surgical team, if you 15 like, appraised of what was happening with this surgical
- patient, do you think he should have contacted somebody 16 to tell them what had happened? 17
- 18 A. Yes, I think -- and that's what he was asked --
- 19 Q. And that's what he did. The person he contacts is the
- 20 SHO.

1

10

- 21 & Ves
- 22 Q. Do you consider that to be appropriate or do you think 23 he should have perhaps gone higher?
- 24 A. I think that in that circumstance he would have
- 25 contacted his next on call, which would have been the

190

- SHO. As I've said, I'm not sure that contact with the
- surgeon full stop is necessarily what one would have 2
- wanted in this situation. 3
- 4 O. Yes. Well, his position is that he's being urged to get
- 5 senior surgical involvement in and that's the message
- 6 that he's receiving.
- 7 A. Sure.
- 8 Q. He does, you are quite right, bleep Mr Zafar, who is his
- 10 not respond to that call because he was dealing with
- 11 something in A&E -- at least that's what he believed was
- 12 the case -- which is pressing and he just couldn't get
- away at that stage. Therefore, it was entirely 13
- unpredictable when Dr Zafar would get free and be able 14
- to come to the ward to see Raychel. In that position, 15
- 16 what do you think should have happened then? Should
- 17 Dr Curran have taken it upon himself to contact
- 18 Mr Bhalla, who was the registrar?
- 19 A. If the SHO couldn't attend and if he had given a clear
- indication that it would be some time before he could 20
- 21 attend, then it would be very reasonable, if the
- 22 paediatricians were wanting surgical input, to contact
- 23 the registrar.
- 24 Q. I think in fairness to Mr Zafar, the reality is that he
- really didn't know how long he would be tied up. All he 25

- could say is: I am tied up and I don't know when I can
- get free. That was his position. Dr Curran's position
- is: I told my SHO that there was this issue, what had
- happened, and effectively, I expected my SHO to contact
- the registrar or make whatever arrangements it would be
- for having more senior surgical involvement.
- A. Okay. I'm not sure how that would have been possible if Mr Zafar was already tied up dealing with something else in the A&E department.
- 10 Q. So that we're not standing on ceremony about who has to 11 contact whom, in your view, would it have b
- 12 appropriate for, once Dr Curran appreciated from
- Mr Zafar that he was tied up, simply to contact the 13
 - registrar himself if Dr Johnston was still saying he
- 15 wanted more senior surgical involvement?
- 16 A. Yes, I think that would be appropriate. I also think
- 17 it would be very appropriate for Dr Johnston to pick up 18 the phone and phone as well. He was the person with the
 - concerns and very often the communication is at
- 20 a slightly more senior level rather than getting the JHO
- 21 to do that if you are really concerned.
- 22 Q. What in fact happened is that -- nothing, really.
- 23 Dr Curran contacted Dr Zafar, Dr Zafar couldn't attend.
- 24 It seems that no further attempt was made to contact
- anyone more senior on the surgical side and Dr Johnston 25

8

14

19

1

- SHO. Mr Zafar's evidence has always been that he could

- was left with the impression: well, somebody's coming in 1 due course. So there was -- perhaps "lacuna" is too 2 strong, but there wasn't the involvement that he wanted, nor was it entirely clear when that was going to happen. Do you regard that as being a bit unsatisfactory? 6 A. Yes, that is unsatisfactory. If there was a need for a surgeon to be there, then if it were possible to get 8 one there, that would have been much more appropriate. 9 Q. Yes. Ultimately, Dr Zafar comes, as does Mr Bhalla and 10 that happens about 5 o'clock, but it's 3.19, almost 11 exactly, when Dr Curran is bleeped and given some brief 12 details of the situation and so there is a period of 13 time when some senior involvement on the surgical side 14 is being sought and isn't received. Is that a bit 15 unsatisfactory as far as you are concerned? 16 A. Again, that is unsatisfactory as far as I'm concern, but again I have to say that I don't think a surgical SHO or 17 surgical registrar were necessarily the appropriate 18
- 19 people to have there at that time.
- 20 Q. By the time Dr Trainor gets to Raychel, or rather very
- 21 shortly after she gets to Raychel, the position is that
- 22 Raychel's serum sodium levels are recorded as being very
- 23 low, they're 119, she has a concern that maybe there's
- 24 an artefact or some problem, but in any event, from the
- 25 lab, they are 119. Raychel's pupils are fixed and

- dilated, she has not responded in any way, her condition
- has not improved, and within a relatively short time of
- Dr Trainor getting there, she contacts her own
- consultant.
- 5 A. Mm-hm.

1

2

10

16

- 6 Q. That's how concerned she is about the situation.
 - A. Mm-hm.
- 8 Q. At that time, the only member of the surgical team is
- Dr Curran. Would you have wanted to know that your
- patient had deteriorated so that she was at a point
- 11 where her pupils were fixed and dilated?
- 12 A. Yes, I would want to have known that.
- 13 Q. If for some reason Dr Curran can't reach the SHO or the
- 14 registrar, for some reason that can't be done, would you 15 have wanted him to just pick up the phone and tell you
 - have wanted him to just pick up the phone and tell you that?
- 17 A. I think he would have called the consultant on call.
- 18 Q. I beg your pardon.
- 19 A. I don't think he would have called me, but I think he
- 20 would have called the consultant on call.
- 21 Q. Yes. And in fact, is that what you would wanted him to 22 do?
- 23 A. If there was no one else available and there was still
- 24 a strong feeling that there was a need for a surgeon 25 there, that would be a reasonable course of action. But

194

- 1 to be fair to Michael Curran, I really don't think that
- 2 that would be expected of a JHO to pick up the phone and
- 3 phone a consultant. I would have expected that to come
- 4 from someone in a slightly more senior position --
- 5 Q. Yes, I understand.
- 6 A. -- either paediatric or surgical.
- 7 Q. I understand. In fact, I was just going to come and ask
- 8 you that question next. One might be forgiven for
- 9 thinking that Dr Curran might have considered himself to
- 10 have been wholly out of his depth in a situation like 11 that.
- 12 A. I think most surgeons would be, regardless of what grade 13 they were.
- 14 Q. Yes. At that stage, just before Dr McCord comes, there 15 are two more senior levels than he on the paediatric
- 16 side. They're there and Dr Trainor's made an assessment
- 17 as best she can and has contacted her consultant. As
- 18 between the different disciplines, if I can put it that
- 19 way, would you have wanted one of them to have let
- 20 a more senior member of the surgical team know: look,
- 21 we've got your patient, she's had a fit, her pupils are
- 22 fixed and dilated, we're doing what we can do manage
- 23 her, we've called our own consultant in, we're letting
- 24 you know?
- 25~ A. I think that would be reasonable, but they would not

- 1 have done it just at that time. There was clearly
- 2 significant activity going on at that time. No one knew
- 3 what was going on, it might well have been that this
- child had had a neurological problem that was not
- related to her surgery at all. I think, whenever the
- situation was somewhat more stabilised, it would have
- 7 been very reasonable to have informed a consultant 8 surgeon.
- surgeon.

10

12

- 9 Q. Well, apart from being reasonable, would you have
 - expected it? Whether it comes from the paediatric side
- 11 or it comes from the surgical side when Mr Zafar and
 - Mr Bhalla get there, irrespective of who, would you have
 - expected somebody to have contacted the consultant
- 14 surgeon to say, "This is the position"?
- 15 A. I would have expected that before the morning.
- 16 Q. Yes.
- 17 A. I don't think anyone wants to walk into that situation 18 unprepared.
- 19 Q. Yes.
- 20 THE CHAIRMAN: I don't quite understand. For what purpose
- 21 would the consultant on call be advised of the disaster 22 with Raychel?
- 23 A. For the purpose of simply knowing that that had
- 24 happened. I don't think that the surgeon necessarily
- 25 would have had any clinical input at that time. I don't

1	think their expertise is what was required at that
2	stage. So it'd be simply in order to inform them that
3	this disaster has happened so that they were appraised
4	of it.
5	THE CHAIRMAN: Right. Not from the perspective of that
6	person being able to contribute anything?
7	A. Correct, not from a clinical point of view. I think
8	this is it'd be the same as someone dying of a heart
9	attack following a major abdominal surgery or having
10	some other major medical catastrophe. It is always
11	useful for the consultant surgeon to know before the
12	following morning, not because they can do anything
13	about it clinically, but simply so that they are
14	informed.
15	MS ANYADIKE-DANES: Would you have wanted to know
16	MR STITT: I beg your pardon. I thought Ms Anyadike-Danes
17	had seen that I was about to make a point. It's
18	following on from your point and now is as good a time
19	to make it as any and I was going to make it in any
20	event.
21	The witness is being asked and pushed about, "Would
22	it not have been good for communication?", "Would he not
23	have expected or wished someone more senior on the
24	surgical side to have been informed?". And he's

25 answered it and I can understand the linear question,

197

it's a question of communication.

1

2

8

10

11

12

- But with respect to the witness, Mr Foster states
- that he doesn't make the case that there was any need
- for surgical input. He is critical of the fact that it
- took so long for the surgeons to come along, but he
- makes it clear that after Raychel suffered her fit:
- "In effect, care was taken over by the
- paediatricians. This care was of high quality."
- He's not making the case that there was any adverse
- outcome because of the absence of the surgeons, though
- he does criticise the delay between the calling of the
- more senior surgical doctor and his arrival. But
- 13 I think it's important --
- 14 MS ANYADIKE-DANES: Mr Chairman, I wasn't actually coming at 15 it from that point of view.
- 16 THE CHAIRMAN: Yes, but there are a number of different
- 17 angles to come at it from and it's not inappropriate for 18 Mr Stitt to --
- 19 MS ANYADIKE-DANES: No, no, no, no --
- 20 THE CHAIRMAN: Excuse me one second. What is the reference?
- 21 MR STITT: 223-002-042, letter (t), if that can be
- 22 highlighted.
- 23 THE CHAIRMAN: So as you interpret that, he's making a point
- 24 about the ... Which was made afterwards, in any event,
- 25 notably by the nurses, about the fact that there wasn't

198

enough surgical cover for the children on Ward 6. 2 MR STITT: He's making that point. How busy it was, probably on surgical duty, emphasises the inadequacy of 3 the cover arrangements. That's a matter which you might 4 5 like to explore. But when it comes to the actual 6 knock-on effect --7 THE CHAIRMAN: That's the matter which the hospital has 8 already accepted, isn't it? 9 MR STITT: Yes. 10 THE CHAIRMAN: Okay. Thank you. 11 MS ANYADIKE-DANES: If I can put up please, 223-002-026, 12 which is Mr Foster's report? If I can take you to the first full paragraph: 13 "Raychel Ferguson was a 9-year-old girl and it was 14 15 little more than 28 hours after an appendicectomy had 16 been performed under the care of the surgical unit 17 at the hospital. I do have to ask at this point as to 18 where was the surgical consultant on call? The 19 paediatricians had attended right up to consultant level 20 and, very shortly afterwards, Dr Nesbitt, consultant 21 anaesthetist and clinical director of anaesthesia, 22 arrived. I have no doubt whatsoever that the consultant 23 surgeon on call should have come in. He should have 24 noted events, made a clinical note and, above all, seen 25 the parents."

1 Then he goes on to say: 2 "It may well be that Mr Gilliland, who was off duty

3

5

6

8

10

11

12

13

14

15

16

17

18

19

20

21

- at this time, was not available and from what I can see from of the notes of the surgeon on call, it doesn't appear [I think he goes on to say] that the consultant surgeon was actually contacted." So Mr Foster's view, as expressed there, is that the
- consultant surgeon on call should have been contacted. He goes on to express the view that he should have come in. But one of the points that I was going to develop with you -- in a way I thought you were going there with that answer, which is not necessarily to have a clinical intervention, but one of the things Dr Foster has noted is that:
 - "... and, above all, seen the parents."
 - That's where I was going to take you to next.
- So if the consultant on call is notified in terms of
- "I'm telling you this is what has happened to one of our
- patients and it's all looking very serious, the parents
- are here", would you have expected or wanted the
- consultant to have spoken to the parents, given that
- she's a surgical patient, if I can put it that way?
- 23 A. That's a pattern of care that I don't recognise from
- 24 practice, the pattern of care that Dr Foster puts out
- 25 here. What he's effectively saying is that whenever

1		a medical problem happens to any patient that causes
2		their death, that he would expect the surgical
3		consultant to come in and speak to that person's
4		relatives. That just doesn't happen within the NHS.
5		That's not a pattern of care that I've ever seen. There
6		were senior clinicians there who could speak to the
7		parents and who perhaps understood the situation much
8		better than a consultant would at that point. So
9		I don't really see Mr Foster's argument here.
10	Q.	Let me sort of help develop it and see if you can help
11		us with it in this way: Raychel was still a surgical
12		patient.
13	A.	She was.
14	Q.	Care had not been transferred, if I can put it that way,
15		to a different discipline, although other disciplines
16		were assisting with her care. So she still remained the
17		responsibility of the surgical team, more specifically
18		you are responsible as her named consultant.
19	A.	Yes.
20	Q.	Would you have considered it appropriate, for that
21		reason, the person taking responsibility or standing in
22		your shoes, as the consultant surgeon on call, should
23		have perhaps, with the treating clinicians, sat down
24		with the parents and spoken to them at some point?

25 A. Again, that's not a pattern of care that I have seen.

201

- Whenever a surgical patient on an adult ward develops
- a major medical catastrophe that results in their death,
- it is not the consultant surgeon who comes in and speaks
- to that patient's relatives; it is the staff who are
- there at the time, be it medical or surgical. It would
- be very uncommon for a consultant to be called in for that reason.
- 8 THE CHAIRMAN: Is your point simply this: that for you to
- have come in -- and obviously I hope Mr and Mrs Ferguson
- understand that when you're expressing this view, you're
- 11 not in any way being light in terms of the
- 12 responsibility of all the doctors towards Raychel. But
- 13 what you're saying is, in terms: if I'd come in at 6 or
 - 7 o'clock that morning and I'd been the one to speak to
- 15 Mr and Mrs Ferguson about Raychel, I would have spoken
- 16 to them, but not as somebody who had seen or treated
- her. Whereas if they were to be spoken to at 6 or 17
- 7 o'clock that morning, the best people to speak to them 18
- 19 were the most senior people who were then involved in
- 20 her care; is that your point?
- 21 A. Yes, that's my point.

1

2

6

10

14

- 22 THE CHAIRMAN: That's not in any way being disrespectful of
- 23 the parents and not in any way being disrespectful of
- the importance of the need for the parents to be spoken 24
- 25 to and to be kept informed as best they can be informed

202

- 1 of what's happening. But if her care at that stage is
- effectively in the hands of a consultant paediatrician 2
- and consultant anaesthetist, and if you are right that 3
- the surgical input would be light, if there's any at 4
- 5 all, then they're best spoken to by the consultants who
- 6 are treating her?
- 7 A. That's correct.
- 8 THE CHAIRMAN: Right
- 9 A. That's correct.
- 10 THE CHAIRMAN: And the view which Mr Foster is really
- 11 expounding is, despite this, she was in fact a surgical 12 patient --
- 13 A. Mm-hm.
- THE CHAIRMAN: -- had been from Thursday night, so then on 14
- Saturday morning it's still the role of the surgeon to 15
- 16 speak, and that's why you say you don't really
- 17 understand where he's coming from on that.
- 18 A. I'm not really sure where he's coming from on that.
- 19 THE CHAIRMAN: Thank you.
- 20 MS ANYADIKE-DANES: Can I take you to Mr Orr's report, who
- has put it in slightly different terms? If we can have 21
- 22 witness statement 320/1 and put up together pages 14 and
- 23 15. So at page 14, you can see the question. This is
- 24 the issue that the Trust has raised with Mr Orr about
- 25 the adequacy of communications that took place between

- the surgical team and Raychel's parents. So that's what 1
 - they've asked him to comment on. And at the top of
- page 15 he says: 3

2

4

5

8

10

13

14

16

17

18

19

- "It would appear that these were inadequate.
- A senior member of the surgical team should have
- attended after Raychel had suffered from her seizure and
- been involved, not only in her management, but in any
- discussions with the family."
 - So although he hasn't cited the senior person as
- being the consultant --
- 11 A. That's correct.
- 12 Q. -- he hasn't said that -- but nonetheless he has said that that person should have:
 - "... been involved in her management and any
- discussions with the family." 15
 - If we leave the management to one side, because
 - you've expressed a view that you think that her
 - management was being catered for by other disciplines,
 - if I can put it that way, he's still saying that he
- 20 thought that somebody should be there from the surgical
- 21 team to speak with the family. I don't think either he 22
 - or Mr Foster are saying that that would necessarily be
 - to the exclusion of anybody else who might be part of
- 24 a discussion with the family, but if I can put it this
- 25 way, that the surgical team should be represented in

- 1 a discussion with the family at senior level. Would you
- 2 accept that that might be appropriate?
- 3 A. That might be appropriate, but ${\tt I}\,{\tt 'm}$ sure that no one at
- 4 that particular time thought about that. I think
- 5 Dr McCord spoke to the family at that stage and
- ${\tt 6}$ \qquad I presume he was happy to speak to them on his own and
- 7 he didn't see a need to involve a surgeon at that time.
- 8~ Q. Mr Bhalla thinks he might have spoken briefly to the
- 9 family, but his evidence was that he then, as part of
- 10 his handover if I can put it that way, communicated what
- 11 had happened to the incoming registrar, who was Mr Date,
- 12 and asked Mr Date to contact either you or the
- 13 consultant to communicate what had happened with Raychel
- 14 and what was being proposed for her. And his view also 15 was that in due course -- if not necessarily then, but
- 16 in due course -- that Raychel's consultant would speak
- 17 to her parents. Leaving aside differences of exactly
- 18 when you think that might happen, in terms of whether
- 19 you think it would have been appropriate for Raychel's
- 20 consultant at some point to speak to her parents, would
- 21 you have thought that appropriate?
- 22 A. That's exactly the point that I was wondering about
- 23 earlier, the timing of this. So we're now at beyond
- 24 9 o'clock in the morning?
- 25 Q. Yes.

- A. The consultant, one would presume, is in the hospital.
 Q. Yes.
- Q. ies.

6

10

11

12

- 3 A. It would seem appropriate that if there was an
- opportunity to do so, that they spoke to the family. Q. Yes. And Raychel leaves -- I think she might leave at
- sometime around 11 o'clock, something of that sort.
- 7 A. Mm-hm.
- 8 0. And by that time, she is in intensive care, she is
- stabilised and, apart from waiting for results to come
- back, they're really waiting for the arrangements to be
- made for her to be transferred to the Children's
- Hospital.
- 13 A. Yes.
- 14 Q. Is that a time when you think might have been
- 15 appropriate to speak to the parents when, if you like, 16 Altnagelvin had done all that it could do?
- 17 A. Yes, I think that would have been appropriate.
- 18 Q. Yes. If you had known about the situation, is that
- 19 something that you would very much have wanted to have 20 happened?
- 21 & Ves

2

8

10

15

18

20

- 22 Q. Just to finish it so that we're clear, this is an area
- 23 of some importance to the family, as you might imagine.
- 24 If you had been on duty then, would you have gone to
- 25 speak to the parents at that stage, excepting that you

- 1 weren't called away for some emergency?
- 2 A. Yes.
- 3 $\,$ Q. You have now read the medical notes and you have --
- 4 THE CHAIRMAN: Sorry. And that's as part of a team? If you
- 5 think it would have been appropriate for a consultant to
- 6 speak to the parents, a consultant surgeon to speak to
- 7 the parents, would it have been along with others who
- 8 had been treating her?
- 9 A. Possibly, but it might have just been -- the others had
- 10 already spoken to the family. As far as I'm aware there
- 11 was contact between Dr Nesbitt, Dr McCord and the family
- 12 at that stage and it wouldn't necessarily have required
- 13 either Dr Nesbitt or Dr McCord to be along with the
- 14 consultant surgeon at that time.
- 15 MS ANYADIKE-DANES: So effectively the clinical matters have
- 16 been explained by those who were treating her and this
- 17 is in the sense of the senior member of the surgical
- 18 team now sitting with the parents and allowing them to
- 19 talk or ask questions and also, almost at a human level,
- 20 dealing with them; is that the sense in which you would
- 21 have seen it?
- 22 A. I think that's correct.
- 23 Q. And if you like, taking responsibility for what had
- 24 happened to their daughter before it was known exactly
- 25 why it had happened, at least being responsible for her?

- I don't mean taking responsibility in terms of blame,
- but being responsible for her care.
- A. She was still a surgical patient, yes, so she was still
 effectively -- under effectively my care.
- 5 Q. Yes. As I was saying, you have now had the opportunity 6 to look at her charts and so on, and so you've seen the
 - information that would have been available, if I can put
 - it that way, had you been able to come in and speak to
 - the parents at that stage. Are you in a position to
 - help with what you would have wanted them to be told?
- A. Well, I'm sure if I'd been in that situation you'd have wanted them to be told Raychel is very seriously ill, we don't quite know exactly what's happened here, and explain exactly what the future might hold and what the
 - explain exactly what the future might hold and what the management plans were.
- 16 Q. And before you did that, would you have tried to have an 17 opportunity to discuss with either of the senior
 - clinicians who had actually treated her at that stage?
- 19 A. I think there would have been a discussion, yes. If
 - I was going to go and speak to the parents there
- 21 definitely would have been a discussion.
- 22 $\hfill Q.$ There are a number of people you could have spoken to:
- 23 you could have spoken to the surgical registrar who was
- 24 there at that stage and/or you could have spoken to
- 25 either Dr Nesbitt, who's the consultant anaesthetist, or

- Dr McCord as the consultant paediatrician. 1
- 2 A. And if that had been me, I know that I would have spoken
- either to Dr Nesbitt or Dr McCord or both.
- 4 Q. And to do that, you're really trying to bring yourself
- up to speed as to what they had done, why they'd done it, and how they saw matters?
- 7 A. What they thought was wrong.
- 8 0. Yes. Would you have had a guick look at the charts
- vourself?
- 10 A. I don't know. I think that would be entirely
- 11 speculative.
- 12 Q. Yes -- sorry.
- 13 A. I was about to say: yes, I'm sure I would have had
- 14 a look at the charts myself because that was one of the
- 15 things that we did fairly quickly after we'd heard that
- this happened. So I suspect if I'd been there at the 16
- time, I'm sure I would have looked at the chart. I'm 17
- sure I would have looked at her operation note to see 18
- 19 was there anything that could have given us any clue as
- 20 to what happened here. So I am sure I would have looked
- 21 at the notes, but as I say, that is to a certain extent
- 22 speculation.
- 23 Q. Yes. I had asked Mr Bhalla what he thought was the
- 24 problem with Raychel at that stage and, if I'm clear
- 25 about what that stage was for him, that stage was having

- arrived at about 5 o'clock, examined her himself
- 2 briefly, seen what was going on, directed certain
- further tests, realised the two serum sodium levels of
- 119 for the first test, 118 for the other, certainly
- seen the first scan --
- 6 A. Mm-hm.

1

8

- Q. -- and seen either actually seen the second scan or been
- informed of what it disclosed, namely that it ruled out
- a haemorrhage that at some point had been thought could
- 10 be seen there. That's the information he had. On that
- basis, he had formed the view that the prognosis was 11
- 12 really very poor indeed for Raychel. In particular, the
- 13 length of time that her pupils had been fixed and
- 14 dilated and that there was no discernable improvement
- 15 from that, notwithstanding the treatment that had been
- provided to her. Would you have shared that view? It's 16
- very difficult to say, I understand that, but on the 17
- basis of that kind of information that was available 18
- 19 would you have also been very concerned about the
- 20 prognosis?
- 21 A. The fixed dilated pupils would be a major cause for 22 concern.
- 23 Q. What would your expectation be of recovery?
- 24 A. Again, it's very difficult for me to say. That's not an
- 25 area that I would have any specialty knowledge in

210

- whatsoever.
- 2 THE CHAIRMAN: Do you come back from fixed dilated pupils?
- Do human beings come back from fixed dilated pupils? 3
- 4 A. Not that I can think of off the top of my head, but
- 5 again there may be causes that I'm unaware of.
- 6 MS ANYADIKE-DANES: From your experience, you would consider
- that to be unlikely; would be that fair?
- 8 A. Again, I have usually seen that situation in a massive
- head injury situation and that is an unrecoverable
- 10 situation. This was new ground to me and perhaps to 11 some of the people treating her.
- 12 Q. In fact, what Mr Bhalla -- and for that matter
- Mr Morrison, who's the radiologist -- describe is 13
- cerebral oedema that is causing a raised intracranial 14
- 15 pressure --16 A. Yes.
- 17 0. -- and that's actually the seat of the problem.
- 18 A. Mm-hm.
- 19 Q. It's the consequences of that raised intracranial
- 20 pressure on her brainstem and so on. That's the
- 21 concern. In those circumstances, I understand that
- 22 obviously you're not a paediatric neurologist, but when
- 23 you hear what's been seen on the scan is gross cerebral
- 24 oedema giving rise to a raised intracranial pressure
- 25 that's having the sort of effects that are being

- witnessed in Raychel, would you have been of a similar 1
- mind to Mr Bhalla, that the prospects of anything 2
- positive happening for Raychel be really guite dire?
- 4 A. I think the prospects of recovery were very poor.
- 5 Q. Thank you. Can I ask you this out of all your experience: how does one address that with the family, the parents?
- 8 A. In terms of what one would say?
- ο.

6

10

16

18

20

- A. You need to get the parents into a room where you're
- 11 away from all other distractions. There would 12
 - preferably be two relatives and two members of staff, either two doctors or a doctor and a nurse. And you
- 13 would start slowly and try and explain what had 14
- happened. You would tend to fire what we describe as 15
 - a warning shot, saying things have not gone very well
- 17 here, Ravchel is very unwell, she's had a seizure and
- she doesn't seem to have been recovering from that 19 particularly well. Then, if you, having done that,
 - probably give a bit more information to say we're very
- 21 concerned about her, we think the outcome here may well
- 22 be very poor, we're doing everything that we can, this
- 23 is the management plan that we have in the future. And
 - within that, you're going to need to give some time for

- 24
- 25 the family just to assimilate that information and

- I would probably give that time immediately after the 1 really bad news came, which was the news that we're very 2 concerned about her, the chances of recovery here may be very poor. A period of time there and then move on to talk about what the plan would be for the future and 6 then give time for any guestions. 7 Q. The parents -- and we will hear their evidence in due 8 course -- recollect that they were being told that Raychel was to be transferred to the Children's Hospital 10 and one of the reasons for that was that there was some 11 prospect that there would be surgery. It's not entirely 12 clear how that emerged. It may be related to the fact 13 that at some point it was thought that there was 14 a haemorrhage in her brain, which is something that 15 might have been susceptible to surgery. It would 16 appear, though, by the time the second scan was done, the enhanced scan, which was specifically to address 17 that, that prospect was ruled out -- the prospect of it 18 19 being a haemorrhage I mean. And the evidence that 20 we have heard so far is that once that had gone, there 21 was little prospect of any surgery actually helping her 22 and the problem now was the cerebral oedema, the gross
- cerebral oedema, and whether there was anything that 23 24 could be done about that. But the way the parents
- 25 interpreted that is that all the time there was

- a suggestion that there was surgery, that was something
- positive, that meant action could be taken and maybe
- that could help. Was there any discussion afterwards about how matters should have actually been addressed with the family?
- 6 A. Not that I can recall specifically. That was not the focus of the critical incident meeting, and again, in terms of just informal discussion, I don't recall any
 - discussion about how the parents should have been
 - approached at that stage.

1

2

8

9

10

13

14

15

16

17

18

19

20

21

22

25

- 11 Q. There is an entry in the notes that indicates, at that 12 first stage of having seen the CT scan, that it was
 - clear or normal and that was communicated. The parents believe that that was communicated to them and that gave
 - them some encouragement that it's bad, but maybe not the worst, if I can put it that way.
 - We're going to come and talk about the critical
 - incident review meeting in a little -- maybe we might
 - not reach it just now. But when the notes were being
 - reviewed, that would be there and seen and it would be appreciated that that was included in the note In
- fact, I can give you the reference because, when you looked at me, I wasn't sure that you had seen where it 23
- 24 came from. It's 020-015-025.
 - It's quite hard to make out because the writing's

214

- 1 very small. About halfway, do you see the "CT brain"? 2 A. Yes.
- 3 O. Then "verbally", this is Dr McCord's note. That seems
- to indicate that he received that verbally. Then, in 4
- 5 a circle, "N", for normal.
- 6 A. Yes.
- 7 Q. So he is recording in her notes that that CT scan of the
- 8 brain indicated normality in some way. When those notes
- were available as part and parcel of trying to piece
- 10 together exactly what had happened with Raychel and why
- 11 it had happened, was there any recognition that that was
- 12 perhaps an inappropriate, as he now accepts, entry into 13 her notes?
- 14 A. That it was inappropriate to write "normal" if he'd been 15 told that the scan was normal?
- 16 Q. No, no, the scan was not normal. The scan wasn't
- 17 normal, the scan showed gross cerebral oedema. So all
- 18 I'm asking you -- I'm not asking you to comment on the
- 19 scan because you weren't there when it was all
- 20 happening, but that would have become apparent for
- Dr McCord to see it, and I'm only asking whether, in the 21
- 22 course of your critical review incident meeting, there
- 23 was any discussion about the communications with the
- 24 family.
- 25 A. Not that I can recall.

- 1 0. That wasn't part of it?
- 2 A. Not that I can recall.
- 3 Q. I understand. Just to tie up the question of
- communication with the family, there was in fact 4
 - a meeting with the family on 3 September. I'm not going
 - to go into that in detail now as it something that we
 - are going to address during governance. But were you
 - aware of that meeting?
- 9 A. Yes.

5

6

8

- 10 Q. Were you invited to it?
- 11
- 12 Q. Can you help as to why you didn't think it was
 - appropriate to attend?
- 14 A. Yes.
- 15 Q. Why?
- 16 A. First of all, I hadn't had the opportunity to meet
- 17 Raychel or her parents. I knew that -- I suspected that
- 18 meeting might be very difficult for all involved, and
- 19 particularly for Raychel's parents, and I thought that
- it would be easier for them to be able to discuss her 20
- death with members of staff, both nursing and medical, 21
- 22 that they'd had the opportunity to meet. Secondly,
- 23 I didn't think there was anything from a surgical point
- 24 of view -- and by that I mean the decision to operate or
- 25 perform the appendicectomy -- that was cause for

1	concern. We felt that the proble	em was in and around
2	fluid management, and I thought	that Dr Nesbitt, who had
3	been the one who had done most o	f the research and had
4	put most of the protocols in pla	ce to change management
5	in Altnagelvin, and Dr McCord, w	ho was a consultant
6	paediatrician, would be best able	e to answer those
7	questions.	
8	Thirdly, as I say, I didn't	think there was
9	a particular surgical issue. I	understand now from
10	reading the transcript of that t	hat there were surgical
11	issues and that there were quest	ions that the family
12	wished to have answered. I'm no	t sure that I would have
13	answered them any better than Dr	Nesbitt, but I regret
14	not being there in order to answ	er those. And finally,
15	I didn't think there was anything	g that I could do at
16	that stage that would help to as	suage Mrs Ferguson or
17	Mr Ferguson's grief. Only they	can say if my presence
18	at that meeting would have been 1	helpful to them.
19	I do not think I could have a	answered anything any
20	better than the answers that the	y got. But if they feel
21	that I have let them down at that	t particular moment in
22	time, then I'm very sorry.	
23	Q. Can I ask you in a slightly diff	erent way? I can see
24	why you say you didn't think that	t you should be there,

25 although you recognise her care was your responsibility.

217

that would have been my responsibility. I didn't think

1 A. Yes.

5 6

8

9

18 19

20

- 2 Q. That meeting with the family, leaving aside whatever may
- have been said to the family at Altnagelvin at the time
- when events were still unfolding and before Raychel had
- been transferred and died, this was the first
- opportunity on the Altnagelvin side to meet with the
- family. So at that point, nobody would have known what
- their guestions might be. They might have wanted to be
- taken right from the beginning and have properly
- 10 explained to them exactly the pattern of her care, even
- 11 matters that were done in a perfectly straightforward
- 12 and acceptable fashion. They might have wanted that and
- 13 nobody would know that. Part of her care was handled by
- 14 the surgeons, so Mr Makar had actually conducted it and
- 15 Mr Zafar had done the ward round and had been, if you
- 16 like, the person who would be directing the pattern of
- her care over that day. Both of those surgeons, one or 17
 - other of the parents had met.
 - When you knew that a meeting like that was going to
 - be arranged, just in case there were any questions
- 21 relating to the earlier part of her care, did you not
- 22 think that it might be appropriate for either or both of
- 23 Mr Makar or Mr Zafar to be there?
- 24 A. I don't think I would have put Mr Makar and Mr Zafar
- into that position. I think if that was to be done, 25

218

2		that there would be questions, but I appreciate that, in	2	THE CHAIRMAN:
3		retrospect, that there were and that there certainly	3	to finish y
4		could have been. As I said, I regret not being there	4	break there
5		for that purpose.	5	might come
6	Q.	Mr Bhalla said in his evidence, if he had known which	6	I think, Mr
7		he didn't know that there was going to be a meeting	7	to hear fro
8		like that, that unless it was considered that it would	8	grateful fo
9		be unhelpful and inappropriate, he would have wanted to	9	necessary,
10		be there. He was the registrar who was there at the	10	think she i
11		time, if I can put it that way, the crisis was	11	Ms Rams
12		unfolding, and he would have wanted to be there.	12	On Wednesda
13	A.	I think that would have been inappropriate.	13	On Thursday
14	Q.	Sorry?	14	previously
15	A.	I think that would have been inappropriate. I think	15	side by sid
16		that if there were surgical questions to be answered,	16	objection t
17		they would be much better answered in that situation by	17	and Mr Orr.
18		an experienced surgeon. And by that I mean	18	but some le
19		a consultant.	19	it's probab
20	Q.	Yes. My reason for putting Mr Bhalla to you in that way	20	one after t
21		is because it indicates a senior member of your team	21	We don'
22		thinking that a surgical person should have been at that	22	that, havin

23 meeting.

1

- 24 A. I heard him say that this morning.
- 25 MS ANYADIKE-DANES: Mr Chairman, I've reached a natural

1 break.

Mr Gilliland, I'm afraid we haven't been able your evidence today. I know during the last were efforts made to arrange a time when you back. The position next week is that --Quinn, the family agrees that we don't need m Auxiliary Nurse Lynch; is that right? I'm or that, that's helpful. If I thought she was I wouldn't hesitate to call her, but I don't s, and I'm grateful for your help on that. ay will give evidence on Tuesday the 19th. y, it'll be Ms Hanratty and Dr Scott-Jupp. , it'll be Mr Foster and Mr Orr. We have in the inquiry had experts giving evidence le in the witness box, and unless there's any o that, I intend to do that with Mr Foster There are some differences between them. vel of agreement between them and I think oly easier to call them together rather than he other. That leaves Mr Haynes on Friday. t think that by the time we get to Mr Haynes that, having heard all the other experts, we don't think 23 that it will take Mr Haynes a full day to give his evidence. That seems to be -- I think you're not sure 24 25 about your commitments tomorrow week. If you could

1	possibly get back to us on that through your solicitors
2	tomorrow. If it's possible to give evidence next Friday
3	afternoon, that would be very helpful, and I'd be
4	grateful to you for your co-operation. I know you're
5	not available for good reason the following week and ${\tt I'm}$
6	not going to query that at all. That would then leave
7	Mr and Mrs Ferguson for Monday the 25th. And that would
8	get us as far as we're going to be able to go on the
9	clinical issues relating to Raychel.
10	I hope to be able to announce early next week the
11	firm dates for the resumption of the hearings in the
12	spring, which will be the aftermath of the death of
13	Lucy Crawford and the further governance issues which we
14	haven't already covered here in Raychel's case.
15	MR STITT: Mr Chairman, if I may I'm conscious of the
16	time, but I'd like to make this point I'm sorry about
17	the earlier interruption, by the way (indicating)
18	it's to do with what happens when Raychel has her
19	seizure and whether or not the surgical team could have
20	actually added any value to the treatment.
21	I appreciate Ms Anyadike-Danes' line of questioning
22	on that, but nonetheless for completeness, I had
23	referred to one report, Ms Anyadike-Danes had referred
24	to another report, and quite reasonably the Orr report
25	had effectively said there was a role to play in

management. She quite properly highlighted that. If I might just come back in relation to the Scott-Jupp report. The first report was the Foster report. The second was Orr. But just for completeness so that you, sir, have the complete picture, and this is a paediatrician. May I call up the document? 7 THE CHAIRMAN: Please do. 8 MR STITT: 222-004-024. If the paragraph 2.7 could be magnified. It deals with normal practice and so on: "The immediate action [five lines down] to treat a seizure and to investigate it for its cause, as detailed above, should be within the competency of any acute general paediatrician." And it's to do with whether there should have been a paediatric neurologist, but that would have taken too much time, but just for completeness the paediatrician is saying it's over to them. I appreciate the communication point and so on, but in terms of Raychel's well-being and her care at that time ... 20 THE CHAIRMAN: Thank you very much. Okay, until Tuesday at 10 30 22 (5.07 pm) (The hearing adjourned until Tuesday 19 March at 10.30 am)

INDEX
