CLINICAL NOTES

DATE/TIME

Seizure - Ammonia level has worn off
and she has been given resuscitation.
findings would suggest that she
shows no signs of brainstem function.

Do CT stat, then probably for EEG.

DDx: infection - herpes

? haemolytic shock and sepsis

? metabolic, e.g. urea cycle defect

? cerebral ischaemia for other cause

No cause is clinically evident as yet

I would suggest, as well as EEG/CT,
the following:

already
done

U/E, LFT

Ammonia

Clotting screen, including FDP etc

Herpes titers

+ Urine for organic acids + toxicology

if for LP, check before PCR

Discussion

> Stool for culture gone from Ewen

CLINICAL NOTES

DATE/TIME

13/02/04 13:40 Blood cultures negative to date (After 24 hrs)
