Form No. M231/RS157

RENAL ULTRASOUND

There is no evidence of hydronephrosis. The right ureter and the left remain dilated. The kidneys are unchanged in size and the renal parenchyma is echogenic.

RIGHT T-TUBE URETEROGRAM

There was free flow of contrast into the bladder and drainage via the suprapubic catheter. The lower end of the ureter is narrow but does not cause any hold up. There is an absence of a normal right pelvicalyceal system. Fine linear opacities are outlined with contrast which ultimately extravasated into the renal parenchyma. The right ureter throughout most of its length is dilated.

SURNAME : STRAIN
FORENAME(S) : ADAM
CASENOTE : U91/12708
D.O.B./SEX : 04-AUG-91 /MALE
REPORT DATE : 02-DEC-91

RENOGRAM (MAG3) 27-NOV-91
Diagnostic Code 81.840

Both kidneys show poor function. The renogram curves are similar in shape to blood background. This makes interpretation difficult. The appearances, therefore, suggest diminishing renal function possibly with some underlying obstruction still present.
