## Measuring Techniques

**Supine length** (recommended up to the age of 3 so that there is overlap with standing height at 2 to 3) is taken on a flat surface, with the child lying on her back. One observer holds her head in contact with a board at the top of the table and another straightens the legs, turns the feet upwards to be at the right angles to the legs and brings a sliding board in contact with the child's heels.

**Weight** should be taken in the nude, or as near thereto as possible. If a surgical gown or minimum underclothing (vest and pants) is worn, then its estimated weight (about 0.1 kg) must be subtracted before weight is recorded. Weights are conveniently recorded to the last completed 0.1 kg. above the age of six months. The bladder should be empty.
