Care, Cerebral Oedema
Status Epilepticus

Wash 1a Cerebral Oedema
caused by b. Meningoencephalitis
+ SINDU

- Then end notes,

2. ~~the~~ Status Epilepticus

D.W. agreed it would have been appropriate to repeat the 121 blood test, but too dangerous.

Should decide today blood should be drawn when blood was taken from it not normal - Yes

Mr McCrea.
Re ADH

4th 129
5th 152

3rd sample 121 at 3.00 am

Drop can be expected not linear

Agreed that medical team would have changed fluid management if blood sample ^{of 22nd} demonstrated been done and had shown a drop in sodium. Asked branch protocol to manage hyponatraemia - No. Was arranged appropriate fluid restriction would have commenced earlier with further blood sampling - No. 8.00 pm where representative to advise parents? DW unaware of deterioration of current condition. 5.00 pm spoken word to Mrs. Roberts - DW repeated briefly but not if any change - until brain dead.

Probably on-call cover, 8.00 pm should have not have been advised - Yes. Immediate blood test. Probably. Then earlier restriction of fluids.
