Dear Michael

Re: Reducing the risk of hyponatraemia when administering intravenous infusions to children

Recently you wrote to the Medical School in relation to reducing the risk of hyponatraemia when administering intravenous infusions to children. I believe I have previously indicated that there is a specific session on this topic in the paediatric undergraduate module. Not only is there a specific session on the topic, but it is emphasised throughout the clinical attachment, and of course, all paediatric units now have posters clearly displayed in relation to the risk of hyponatraemia in children.

I will copy your letter and my response to Dr Carson, the Head of the Department of Child Health, in order to re-emphasise the importance of this issue.

Yours sincerely

Professor Maurice Savage
Director of Education
